## Chapter

# Relaxation Dynamics of Point Vortices 

Ken Sawada and Takashi Suzuki

#### Abstract

We study a model describing relaxation dynamics of point vortices, from quasistationary state to the stationary state. It takes the form of a mean field equation of Brownian point vortices derived from Chavanis, and is formulated by our previous work as a limit equation of the patch model studied by Robert-Someria. This model is subject to the micro-canonical statistic laws; conservation of energy, that of mass, and increasing of the entropy. We study the existence and nonexistence of the global-in-time solution. It is known that this profile is controlled by a bound of the negative inverse temperature. Here we prove a rigorous result for radially symmetric case. Hence $E / M^{2}$ large and small imply the global-in-time and blowup in finite time of the solution, respectively. Where E and M denote the total energy and the total mass, respectively.

Keywords: point vortex, quasi-equilibrium, relaxation dynamics

## 1. Introduction

Our purpose is to study the system

$$
\begin{aligned}
& \omega_{t}+\nabla \cdot \omega \nabla^{\perp} \psi=\nabla \cdot(\nabla \omega+\beta \omega \nabla \psi) \quad \text { in } \Omega \times(0, T), \\
& \frac{\partial \omega}{\partial \nu}+\left.\beta \omega \frac{\partial \psi}{\partial \nu}\right|_{\partial \Omega}=0,\left.\quad \omega\right|_{t=0}=\omega_{0}(x)
\end{aligned}
$$

with

$$
\begin{equation*}
-\Delta \psi=\omega \text { in } \Omega,\left.\quad \psi\right|_{\partial \Omega}=0, \quad \beta=-\frac{\int_{\Omega} \nabla \omega \cdot \nabla \psi}{\int_{\Omega} \omega|\nabla \psi|^{2}}, \tag{2}
\end{equation*}
$$

where $\Omega \subset \mathbf{R}^{2}$ is a bounded domain with smooth boundary $\partial \Omega, \nu$ is the outer unit normal vector on $\partial \Omega$, and

$$
\begin{equation*}
\nabla=\binom{\frac{\partial}{\partial x_{1}}}{\frac{\partial}{\partial x_{2}}}, \quad \nabla^{\perp}=\binom{\frac{\partial}{\partial x_{2}}}{-\frac{\partial}{\partial x_{1}}}, \quad x=\left(x_{1}, x_{2}\right) . \tag{3}
\end{equation*}
$$

The unknown $\omega=\omega(x, t) \in \mathbf{R}$ stands for a mean field limit of many point vortices,

$$
\begin{equation*}
\omega(x, t) d x=\sum_{i=1}^{N} \alpha_{i} \delta_{x_{i}(t)}(d x) \tag{4}
\end{equation*}
$$

It was derived, first, for Brownian point vortices by [1, 2], with $\beta=\beta(t)$ standing for the inverse temperature. Then, [3, 4] reached it by the Lynden-Bell theory [5] of relaxation dynamics, that is, as a model describing the movement of the mean field of many point vortices, from quasi-stationary state to the stationary state. This model is consistent to the Onsager theory [6-12] on stationary states and also the patch model proposed by [13, 14], that is,

$$
\begin{equation*}
\omega(x, t)=\sum_{i=1}^{N_{p}} \sigma_{i} 1_{\Omega_{i}(t)}(x) \tag{5}
\end{equation*}
$$

where $N_{p}, \sigma_{i}$, and $\Omega_{i}(t)$ denote the number of patches, the vorticity of the $i$-th patch, and the domain of the $i$-th patch, respectively [15-17].

This chapter is concerned on the one-sided case of

$$
\begin{equation*}
\omega_{0}=\omega_{0}(x)>0 \tag{6}
\end{equation*}
$$

If this initial value is smooth, there is a unique classical solution to (1)-(4) local in time, denoted by $\omega=\omega(x, t)$, with the maximal existence time $T=T_{\max } \in(0,+\infty]$. More precisely, the strong maximum principle to (1) guaranttes

$$
\begin{equation*}
\omega=\omega(x, t)>0 \quad \text { on } \bar{\Omega} \times[0, T) \tag{7}
\end{equation*}
$$

Then, the Hopf lemma to the Poisson equation in (2) ensures

$$
\begin{equation*}
\left.\frac{\partial \psi}{\partial \nu}\right|_{\partial \Omega}<0 \tag{8}
\end{equation*}
$$

and hence the well-definedness of

$$
\begin{equation*}
-\beta=\frac{\int_{\Omega} \nabla \omega \cdot \nabla \psi}{\int_{\Omega} \omega|\nabla \psi|^{2}} \tag{9}
\end{equation*}
$$

We confirm that system (1)-(3) satisfies the requirements of isolated system of thermodynamics. First, the mass conservation is derived from (1) as

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega} \omega=0 \tag{10}
\end{equation*}
$$

because

$$
\begin{equation*}
\left.\nu \cdot \nabla^{\perp} \psi\right|_{\partial \Omega}=0 \tag{11}
\end{equation*}
$$

holds by (2). Second, the energy conservation follows as

$$
\begin{align*}
\frac{1}{2} \frac{d}{d t}\|\nabla \psi\|_{2}^{2} & =\left(\nabla \psi, \nabla \psi_{t}\right)=\left(\omega_{t}, \psi\right) \\
& =\left(\omega \nabla^{\perp} \psi, \nabla \psi\right)-(\nabla \omega+\beta \omega \nabla \psi, \nabla \psi)  \tag{12}\\
& =-(\nabla \omega, \nabla \psi)-\beta \int_{\Omega} \omega|\nabla \psi|^{2}=0
\end{align*}
$$

by (1) and (2), because

$$
\begin{equation*}
\nabla^{\perp} \psi \cdot \nabla \psi=0 \tag{13}
\end{equation*}
$$

where (, ) denotes the $L^{2}$ inner product. Third, the entropy increasing is achieved, writing (1) as

$$
\begin{equation*}
\omega_{t}=\nabla \cdot \omega\left(-\nabla^{\perp} \psi+\nabla(\log \omega+\beta \psi)\right),\left.\quad \frac{\partial}{\partial \nu}(\log \omega+\beta \psi)\right|_{\partial \Omega}=0 . \tag{14}
\end{equation*}
$$

In fact, it then follows that

$$
\begin{equation*}
\int_{\Omega} \omega_{t}(\log \omega+\beta \psi)=\int_{\Omega} \omega \nabla^{\perp} \psi \cdot \nabla(\log \psi+\beta \psi)-\omega|\nabla(\log \omega+\beta \psi)|^{2} d x \tag{15}
\end{equation*}
$$

with

$$
\begin{align*}
\int_{\Omega} \omega \nabla^{\perp} \psi \cdot \nabla(\log \omega+\beta \psi) & =\int_{\Omega} \nabla \omega \cdot \nabla^{\perp} \psi  \tag{16}\\
& =\int_{\partial \Omega} \omega \nu \cdot \nabla^{\perp} \psi-\int_{\Omega} \omega \nabla \cdot\left(\nabla^{\perp} \psi\right)=0
\end{align*}
$$

from (11) and

$$
\begin{equation*}
\nabla^{\perp} \cdot \nabla=\nabla \cdot \nabla^{\perp}=0 . \tag{17}
\end{equation*}
$$

Since

$$
\begin{equation*}
\int_{\Omega} \omega_{t} \log \omega=\frac{d}{d t} \int_{\Omega} \omega(\log \omega-1), \quad \int_{\Omega} \omega_{t} \psi=\frac{1}{2} \frac{d}{d t}\|\nabla \psi\|_{2}^{2}=0, \tag{18}
\end{equation*}
$$

We thus end up with the mass conservation

$$
\begin{equation*}
M=\int_{\Omega} \omega \tag{19}
\end{equation*}
$$

the energy conservation

$$
\begin{equation*}
E=\|\nabla \psi\|_{2}^{2}=(\psi, \omega), \tag{20}
\end{equation*}
$$

and the entropy increasing

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega} \omega(\log \omega-1)=-\int_{\Omega} \omega|\nabla(\log \omega+\beta \psi)|^{2} \leq 0 . \tag{21}
\end{equation*}
$$

Henceforth, $C>0$ stands for a generic constant. In the previous work [4] we studied radially symmetric solutions and obtained a criterion for the existence of the solution global in time. Here, we refine the result as follows, where $B(0,1)$ denotes the unit ball.

Theorem 1 Let

$$
\begin{equation*}
\Omega=B(0,1), \quad \omega_{0}=\omega_{0}(r), \quad \omega_{0 r}<0, \quad 0<r=|x| \leq 1 . \tag{22}
\end{equation*}
$$

Then there is $C_{0}>0$ such that

$$
\begin{equation*}
C_{0}\left\|\omega_{0}\right\|_{2}^{3} \leq E \underline{\omega} \Rightarrow T=+\infty, \quad\|\omega(\cdot, t)\|_{\infty} \leq C, t \geq 0 \tag{23}
\end{equation*}
$$

where

$$
\begin{equation*}
\underline{\omega}=\min _{\bar{\Omega}} \omega_{0}>0 . \tag{24}
\end{equation*}
$$

Theorem 2 Under the assumption of (22) there is $\delta_{0}>0$ such that

$$
\begin{equation*}
\frac{E}{M^{2}}<\delta_{0} \Rightarrow T<+\infty \tag{25}
\end{equation*}
$$

Remark 1 Since

$$
\begin{align*}
\left\|\omega_{0}\right\|_{2}^{3} & =\left(\int_{\Omega} \omega_{0}^{2}\right)^{3 / 2} \geq\left(\underline{\omega}^{2 / 3} \int_{\Omega} \omega_{0}^{4 / 3}\right)^{3 / 2}  \tag{26}\\
& =\underline{\omega}\left(\int_{\Omega} \omega_{0}^{4 / 3}\right)^{3 / 2} \geq \underline{\omega}|\Omega|^{-1 / 2}\left(\int_{\Omega} \omega_{0}\right)^{2}=\underline{\omega}|\Omega|^{-1 / 2} M^{2}
\end{align*}
$$

the assumption (23) implies

$$
\begin{equation*}
\frac{E}{M^{2}} \geq C_{0}|\Omega|^{-1 / 2} \tag{27}
\end{equation*}
$$

Therefore, roughly, the conditions $E / M^{2} \gg 1$ and $E / M^{2} \ll 1$ imply $T=+\infty$ and $T<+\infty$, respectively.

Remark 2 The assumption (22) implies

$$
\begin{equation*}
\beta=\beta(t)<0, \quad 0 \leq t<T, \tag{28}
\end{equation*}
$$

and then we obtain Theorem 1. In other words, the conclusion of this theorem arises from (28), without (22).

## Remark 3 Since

$$
\begin{equation*}
\frac{E}{M^{2}}=\frac{\int_{\Omega}|\nabla \psi|^{2}}{\left(\int_{\Omega} \omega\right)^{2}} \tag{29}
\end{equation*}
$$

it holds that

$$
\begin{equation*}
\frac{E}{M^{2}}=\|\nabla c\|_{2}^{2}, \quad c=\frac{(-\Delta)^{-1} \omega_{0}}{\int_{\Omega} \omega_{0}}=\frac{\psi_{0}}{\int_{\partial \Omega}-\frac{\partial \psi_{0}}{\partial \nu}}, \tag{30}
\end{equation*}
$$

where $\psi_{0}=(-\Delta)^{-1} \omega_{0}$.
The system (1)-(4) thus obays a profile of the micro-canonical ensemble. In a system associated with the canonical ensemble, the inverse temperature $\beta$ is a constant in (1) independent of $t$, with the third equality in (2) elimiated:

$$
\begin{align*}
& \omega_{t}+\nabla \cdot \omega \nabla^{\perp} \psi=\nabla \cdot(\nabla \omega+\beta \omega \nabla \psi), \quad \frac{\partial \omega}{\partial \nu}+\left.\beta \omega \frac{\partial \psi}{\partial \nu}\right|_{\partial \Omega}=0,\left.\quad \omega\right|_{t=0}=\omega_{0}(x)>0 \\
& -\Delta \psi=\omega,\left.\quad \psi\right|_{\partial \Omega}=0 . \tag{31}
\end{align*}
$$

Then there arise the mass conservation

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega} \omega=0, \tag{32}
\end{equation*}
$$

and the free energy decreasing

$$
\begin{equation*}
\frac{d}{d t} \int_{\Omega} \omega(\log \omega-1)+\frac{\beta}{2}|\nabla \psi|^{2} d x=-\int_{\Omega} \omega|\nabla(\log \omega+\beta \psi)|^{2} \leq 0 . \tag{33}
\end{equation*}
$$

The system (31) without vortex term,

$$
\begin{align*}
& \omega_{t}=\nabla \cdot(\nabla \omega+\beta \omega \nabla \psi), \quad \frac{\partial \omega}{\partial \nu}+\left.\beta \omega \frac{\partial \psi}{\partial \nu}\right|_{\partial \Omega}=0,\left.\quad \omega\right|_{t=0}=\omega_{0}(x)>0  \tag{34}\\
& -\Delta \psi=\omega,\left.\quad \psi\right|_{\partial \Omega}=0 .
\end{align*}
$$

is called the Smoluchowski-Poisson equation. This model is concerned on the thermodynamics of self-gravitating Brownian particles [18] and has been studied in the context of chemotaxis [19-23]. We have a blowup threshold to (34) as a consequence of the quantized blowup mechanism [19, 23]. The results on the existence of the bounded global-in-time solution [24-26] and blowup of the solution in finite time [27] are valid even to the case that $\beta$ is a function of $t$ as in $\beta=\beta(t)$. provided with the vortex term $\nabla \cdot \omega \nabla^{\perp} \psi$ on the right-hand side. We thus obtain the following theorems.

Theorem 3 It holds that

$$
\begin{equation*}
-\beta(t) \leq \delta, \quad\left\|\omega_{0}\right\|_{1}<8 \pi \delta^{-1} \Rightarrow T=+\infty, \quad\|\omega(\cdot, t)\|_{\infty} \leq C \tag{35}
\end{equation*}
$$

in (31), where $\delta>0$ is arbitrary.
Theorem 4 It holds that
$-\beta(t) \geq \delta, \quad\left\|\omega_{0}\right\|_{1}>8 \pi \delta^{-1} \Rightarrow \exists \omega_{0}>0, \quad\left\|\omega_{0}\right\|_{1}>8 \pi \delta^{-1} \quad$ such that $T<+\infty$
in (31), where $\delta>0$ is arbitrary.
Remark 4 In the context of chemotaxis in biology, the boundary condition of $\psi$ is required to be the form of Neumann zero. The Poisson equation in (34) is thus replaced by

$$
\begin{equation*}
-\Delta \psi=\omega-\frac{1}{|\Omega|} \int_{\Omega} \omega,\left.\quad \frac{\partial \psi}{\partial \nu}\right|_{\partial \Omega}=0 \tag{37}
\end{equation*}
$$

or

$$
\begin{equation*}
-\Delta \psi+\psi=\omega,\left.\quad \frac{\partial \psi}{\partial \nu}\right|_{\partial \Omega}=0 \tag{38}
\end{equation*}
$$

by [28] and [29], respectively. In this case there arises the boundary blowup, which reduces the value $8 \pi$ in Theorems 3-4 to $4 \pi$. The value $8 \pi$ in Theorems 3-4, therefore, is a consequence of the exclusion of the boundary blowup [30]. This property is valid even for (37) or (38) of the Poisson part, if (22) is assumed.

Remark 5 The requirement to $\omega_{0}$ in Theorem 4 is the concentration at an interior point, which is not necessary in the case of (22). Hence Theorems 3 and 4 are refined as

$$
\begin{equation*}
-\beta(t) \leq \delta, \quad\left\|\omega_{0}\right\|_{1}<8 \pi \delta^{-1} \Rightarrow T=+\infty, \quad\|\omega(\cdot, t)\|_{\infty} \leq C \tag{39}
\end{equation*}
$$

and

$$
\begin{equation*}
-\beta(t) \geq \delta, \quad\left\|\omega_{0}\right\|_{1}>8 \pi \delta^{-1} \Rightarrow T<+\infty, \tag{40}
\end{equation*}
$$

if (22) holds in (35). The main task for the proof of Theorems 1 and 2, therefore, is a control of $\beta=\beta(t)$ in (1).

This paper is composed of four sections and an appendix. Section 2 is devoted to the study on the stationary solutions, and Theorems 1 and 2 are proven in Sections 3 and 4, respectively. Then Theorem 4 is confirmed in Appendix.

## 2. Stationary states

First, we take the canonical system (31) with $\beta$ independent of $t$. By (32) and (33), its stationary state is defined by

$$
\begin{equation*}
\log \omega+\beta \psi=\text { constant, } \quad \omega=\omega(x)>0, \quad \int_{\Omega} \omega=M \tag{41}
\end{equation*}
$$

Then it holds that

$$
\begin{equation*}
\omega=\frac{M e^{-\beta \psi}}{\int_{\Omega} e^{-\beta \psi}} \tag{42}
\end{equation*}
$$

and hence

$$
\begin{equation*}
-\Delta \psi=\frac{M e^{-\beta \psi}}{\int_{\Omega} e^{-\beta \psi}},\left.\quad \psi\right|_{\partial \Omega}=0 . \tag{43}
\end{equation*}
$$

There arises an oredered structure arises in $\beta<0$, as observed by [11], as a consequence of a quantized blowup mechanism [19, 20, 31]. In the microcanonical system (1) and (2), the value $\beta$ in (43) has to be determined by $E$ besides $M$.

Equality (21), however, still ensures (41) and hence (42) in the stationary state even for (1)-(3). Writing

$$
\begin{equation*}
v=-\beta \psi, \quad \mu=\frac{-\beta M}{\int_{\Omega} e^{-\beta \psi}}, \tag{44}
\end{equation*}
$$

we obtain

$$
\begin{equation*}
-\Delta v=\mu e^{v} \text { in } \Omega,\left.\quad v\right|_{\partial \Omega}=0, \quad \frac{E}{M^{2}}=\frac{\|\nabla v\|_{2}^{2}}{\left(\int_{\Omega}-\frac{\partial v}{\partial v}\right)^{2}} \tag{45}
\end{equation*}
$$

by (30) and (43).
This system is the stationary state of (1) and (2) introduced by [4]. The first two equalities

$$
\begin{equation*}
-\Delta v=\mu e^{v},\left.\quad v\right|_{\partial \Omega}=0 \tag{46}
\end{equation*}
$$

comprise a nonlinear elliptic eigenvalue problem and the unknown eigenvalue $\mu$ is determined by the third equality,

$$
\begin{equation*}
\frac{E}{M^{2}}=\frac{\|\nabla v\|_{2}^{2}}{\left(\int_{\Omega}-\frac{\partial v}{\partial v}\right)^{2}} . \tag{47}
\end{equation*}
$$

The elliptic theory ensures rather deailed features of the set of solutions to (46). Here we note the following facts [31].

1. There is $\bar{\mu}=\mu(\Omega)>0$ such that the problem (46) does not admit a solution for $\mu>\bar{\mu}$.
2. Each $\mu \leq 0$ admits a unique solution.
3. Each $0<\delta<\bar{\mu}$ admits a constant $C=C(\delta)>0$ such that $\|v\|_{\infty} \leq C$ for any solution $v=v(x)$.
4. There is a family of solutions $\{(\mu, v)\}$ such that $\mu \downarrow 0$ and $\|v\|_{\infty} \rightarrow+\infty$.

We show the following theorem, consistent to Theorem 2.
Theorem 5 If $\Omega=B(0,1) \subset \mathbf{R}^{2}$, there is $\delta>0$ such that any solution $(v, \mu)$ to (45) admits

$$
\begin{equation*}
\frac{E}{M^{2}} \geq \delta \tag{48}
\end{equation*}
$$

Proof: If $\mu=0$, it holds that $v=0$. We have $\pm v>0$ exclusively in $\Omega$, provided that $\pm \mu>0$, respectively. By the elliptic theory [32], therefore, any solution $v$ to (46) is radially symmetric as in $v=v(r), r=|x|$. We have, furthermore, $\pm v_{r}<0$ in $0<r \leq 1$, if $\pm \mu>0$, respectively.

Then it holds that $\psi=\psi(r)$, and hence

$$
\begin{equation*}
-\frac{1}{r}\left(r \psi_{r}\right)_{r}=\omega \text { in } 0<r \leq 1,\left.\quad \psi\right|_{r=1}=0 \tag{49}
\end{equation*}
$$

by (42) and (43), which implies

$$
\begin{equation*}
-r \psi_{r}(r)=\int_{0}^{r} s \omega(s) d s>0, \quad 0<r \leq 1 . \tag{50}
\end{equation*}
$$

We thus obtain $\mu \neq 0$, in particular.
If $\mu<0$ we have $\beta>0$ by (44), and therefore, $\psi_{r}>0$ in $0<r \leq 1$ by $v_{r}>0$ there. It is a contradiction, and hence $\mu>0$. In this case, the solution $v=v(r)$ to (46) is explicit [31]. The numbers of the solution is 0,1 , and 2 , according to $\mu>2, \mu=2$, and $0<\mu<2$, respectively, and if $0<\mu \leq 2$ the solutions $v=v_{ \pm}$are given as

$$
\begin{equation*}
v_{ \pm}(r)=\log \frac{8 \gamma_{ \pm} r}{\left(1+\gamma_{ \pm} r^{2}\right)^{2}}, \quad \gamma_{ \pm}=\frac{4}{\mu}\left\{1-\frac{\mu}{4} \pm\left(1-\frac{\mu}{2}\right)^{1 / 2}\right\} . \tag{51}
\end{equation*}
$$

In fact, we have $\gamma_{+}=\gamma_{-}$for $\mu=2$.
This solution is parametrized by

$$
\begin{equation*}
\sigma=\int_{\Omega} \mu e^{v} \in(0,8 \pi) . \tag{52}
\end{equation*}
$$

Hence each $0<\sigma<8 \pi$ admits a unique solution $(v, \mu)$ to (46), and $v=v_{+}$and $v=v_{-}$according as $\sigma \geq 4 \pi$ and $\sigma \leq 4 \pi$, respectively. It holds also that $\mu \downarrow 0$ if either
$\sigma \uparrow 8 \pi$ or $\sigma \downarrow 0$. Thus we have only to confirm that $E / M^{2}$ is bounded, both as $\sigma \uparrow 8 \pi$ and $\sigma \downarrow 0$.

As $\sigma \uparrow 8 \pi$, we have

$$
\begin{equation*}
v=v_{+}(x) \rightarrow 4 \log \frac{1}{|x|} \quad \text { locally uniformly on } \bar{\Omega} \backslash\{0\} \tag{53}
\end{equation*}
$$

and hence

$$
\begin{equation*}
\|\nabla v\|_{2}^{2} \rightarrow+\infty, \quad \int_{\partial \Omega}-\frac{\partial v}{\partial \nu} \rightarrow 8 \pi \tag{54}
\end{equation*}
$$

which implies

$$
\begin{equation*}
\lim _{\sigma \uparrow 8 \pi} \frac{E}{M^{2}}=+\infty . \tag{55}
\end{equation*}
$$

As $\sigma \downarrow 0$, on the other hand, we have

$$
\begin{equation*}
v=v_{-}(x) \rightarrow 0 \quad \text { uniformly in } \bar{\Omega} . \tag{56}
\end{equation*}
$$

Since $\mu \downarrow 0$, furthermore, there arises that

$$
\begin{equation*}
\gamma=\gamma_{-}=\frac{4}{\mu}\left\{1-\frac{\mu}{4}-\left(1-\frac{\mu}{2}\right)^{1 / 2}\right\}=\mu(1+o(1)) . \tag{57}
\end{equation*}
$$

It holds also that

$$
\begin{equation*}
v(r)=\log \frac{8 \gamma}{\mu}-2 \log \left(1+\mu r^{2}\right) \tag{58}
\end{equation*}
$$

and hence

$$
\begin{equation*}
v_{r}(r)=-\frac{4 \mu r}{\left(1+\mu r^{2}\right)^{2}}=-4 \mu r(1+o(1)) \quad \text { uniformly on } \bar{\Omega} . \tag{59}
\end{equation*}
$$

Then, (59) implies

$$
\begin{align*}
\|\nabla v\|_{2}^{2} & =2 \pi \int_{0}^{1} v_{r}^{2} r d r=2 \pi \cdot 16 \mu^{2} \cdot \int_{0}^{1} r^{3} d r \cdot(1+o(1))  \tag{60}\\
& =8 \pi \mu^{2}(1+o(1))
\end{align*}
$$

as well as

$$
\begin{equation*}
\left(\int_{\partial \Omega}-\frac{\partial v}{\partial \nu}\right)^{2}=16 \mu^{2} \cdot 2 \pi(1+o(1)) \tag{61}
\end{equation*}
$$

It thus follows that

$$
\begin{equation*}
\lim _{\sigma \downarrow 0} \frac{E}{M^{2}}=\frac{1}{4} \tag{62}
\end{equation*}
$$

and hence the conclusion.

## 3. Proof of Theorem 1

The first observation is the following lemma.
Lemma 1 Under the assumption of (22), it holds that

$$
\begin{equation*}
\beta=\beta(t)<0, \quad \omega_{r}(r, t)<0, \quad 0<r \leq 1, \quad 0 \leq t<T . \tag{63}
\end{equation*}
$$

Proof: We have (7) and hence

$$
\begin{equation*}
\psi_{r}(r, t)<0, \quad 0<r \leq 1, \quad 0 \leq t<T \tag{64}
\end{equation*}
$$

by (49), which implies, in particular,

$$
\begin{equation*}
\beta=-\frac{(\nabla \omega, \nabla \psi)}{\int_{\Omega} \omega|\nabla \psi|^{2}}<0 \tag{65}
\end{equation*}
$$

at $t=0$ by (22).
Since $\omega=\omega(r, t)$ and $\psi=\psi(r, t)$, we obtain $\nabla^{\perp} \psi=0$, and hence

$$
\begin{equation*}
\omega_{t}=\omega_{r r}+\frac{1}{r} \omega_{r}+\beta \psi_{r} \omega_{r}-\beta \omega^{2} \tag{66}
\end{equation*}
$$

by (1). Then $z=\omega_{r}$ satisfies

$$
\begin{align*}
& z_{t}=z_{r r}-\frac{1}{r^{2}} z+\frac{1}{r} z_{r}+\beta \psi_{r r} z+\beta \psi_{r} z_{r}-2 \beta \omega z, \quad 0<r \leq 1, \quad 0 \leq t<T  \tag{67}\\
& \left.z\right|_{r=0}=0,\left.\quad z\right|_{t=0}=\omega_{0 r}(r)<0, \quad 0<r \leq 1
\end{align*}
$$

and

$$
\begin{equation*}
z=-\beta \omega \psi_{r}, \quad r=1, \quad 0 \leq t<T \tag{68}
\end{equation*}
$$

Putting

$$
\begin{equation*}
m(t)=\min _{\partial \Omega} z(\cdot, t)=\left.\omega_{r}(\cdot, t)\right|_{r=1} \tag{69}
\end{equation*}
$$

we obtain $m(0)<0$ from the assumption. If there is $0<t_{0}<$ such that

$$
\begin{equation*}
m(t)<0, \quad 0 \leq t<t_{0}<T, \quad m\left(t_{0}\right)=0, \tag{70}
\end{equation*}
$$

we obtain $z(r, t)>0$ for $0 \leq t<t_{0}, 0<r \leq 1$, and $t=t_{0}, 0<r<1$ by the strong maximum principle. By (64), we have (65) for $0 \leq t \leq t_{0}$, that is,

$$
\begin{equation*}
\beta=-\frac{\int_{0}^{1} \psi_{r} z r d r}{\int_{0}^{1} \omega \psi_{r}^{2} r d r}<0, \quad 0 \leq t \leq t_{0} \tag{71}
\end{equation*}
$$

and hence

$$
\begin{equation*}
z=-\beta \omega \psi_{r}<0 \quad r=1, t=t_{0} \tag{72}
\end{equation*}
$$

a contradiction. It holds that $z=\omega_{r}<0$ for $0 \leq t<T, r=1$, and hence

$$
\begin{equation*}
\beta=-\frac{\int_{0}^{1} \psi_{r} \omega_{r} r d r}{\int_{0}^{1} \omega \psi_{r}^{2} r d r}<0, \quad 0 \leq t<T \tag{73}
\end{equation*}
$$

The proof of Theorem 3 relies on the fact

$$
\begin{equation*}
\beta \geq-C, \int_{\Omega} \omega(\log \omega-1) \leq C \Rightarrow T=+\infty,\|\omega(\cdot, t)\|_{\infty} \leq C \tag{74}
\end{equation*}
$$

This property is known for the Smoluchoski-Poisson equation (34), but the proof is valid even to (31) with vortex term. Having (21), therefore, we have to provide the inequality $\beta \geq-C$.

The inequality $\beta<0$, on the other hand, is sufficient for the following arguments.

Lemma 2 If $\beta \leq 0,0 \leq t<T$, it holds that

$$
\begin{equation*}
\omega \geq \underline{\omega} \equiv \min _{\bar{\Omega}} \omega_{0}>0 \quad \text { on } \bar{\Omega} \times[0, T) . \tag{75}
\end{equation*}
$$

Proof: Since (17) we obtain

$$
\begin{align*}
\omega_{t}+\nabla^{\perp} \psi \cdot \nabla \omega & =\Delta \omega+\beta \nabla \psi \cdot \nabla \omega+\beta \Delta \psi \\
& =\Delta \omega+\beta \nabla \psi \cdot \nabla \omega-\beta \omega^{2}  \tag{76}\\
& \geq \Delta \omega+\beta \nabla \psi \cdot \nabla \omega \quad \text { in } \Omega \times(0, T)
\end{align*}
$$

with

$$
\begin{equation*}
-\frac{\partial \omega}{\partial \nu}=\beta \omega \frac{\partial \psi}{\partial \nu}>0 \quad \text { on } \partial \Omega \times[0, T) \tag{77}
\end{equation*}
$$

by (8). Then the result follows from the comparison theorem.
Lemma 3 Under the assumption of the previous lemma, there is $C_{0}=C_{0}(\Omega)>0$ such that

$$
\begin{equation*}
C_{0}\left\|\omega_{0}\right\|_{2}^{3} \leq E \underline{\omega} \Rightarrow\|\omega(\cdot, t)\|_{2} \leq\left\|\omega_{0}\right\|_{2}, \quad-\beta(t) \leq \alpha \equiv \frac{\left\|\omega_{0}\right\|_{2}^{2}}{E \underline{\omega}}, \quad 0 \leq t<T . \tag{78}
\end{equation*}
$$

Proof: Using (11) and (17), we obtain

$$
\begin{align*}
\int_{\Omega}\left[\nabla \cdot\left(\omega \nabla^{\perp} \psi\right)\right] \omega & =\int_{\Omega} \omega \nabla \omega \cdot \nabla^{\perp} \psi=\frac{1}{2} \int_{\Omega} \nabla \omega^{2} \cdot \nabla^{\perp} \psi  \tag{79}\\
& =-\frac{1}{2} \int_{\Omega} \omega^{2} \nabla \cdot \nabla^{\perp} \psi=0 .
\end{align*}
$$

Hence (1) with (2) implies

$$
\begin{align*}
\frac{1}{2} \frac{d}{d t}\|\omega\|_{2}^{2}+\|\nabla \omega\|_{2}^{2} & =-\beta \int_{\Omega} \omega \nabla \psi \cdot \nabla \omega=-\frac{\beta}{2}\left(\nabla \psi, \nabla \omega^{2}\right) \\
& =-\frac{\beta}{2} \int_{\partial \Omega} \omega^{2} \frac{\partial \psi}{\partial \nu}+\frac{\beta}{2}\left(\Delta \psi, \omega^{2}\right) \leq-\frac{\beta}{2}\|\omega\|_{3}^{3} \tag{80}
\end{align*}
$$

by $\beta \leq 0$ and (88). Since

$$
\begin{equation*}
\int_{\Omega} \nabla \omega \cdot \nabla \psi=\int_{\partial \Omega} \omega \frac{\partial \psi}{\partial \nu}+\int_{\Omega} \omega(-\Delta \psi) \leq \int_{\Omega} \omega^{2} \tag{81}
\end{equation*}
$$

follows from (8), furthermore, it holds that

$$
\begin{equation*}
-\beta=\frac{\int_{\Omega} \nabla \omega \cdot \nabla \psi}{\int_{\Omega} \omega|\nabla \psi|^{2}} \leq \underline{\omega}^{-1} \cdot \frac{\|\omega\|_{2}^{2}}{\|\nabla \psi\|_{2}^{2}}=\frac{1}{E \underline{\omega}}\|\omega\|_{2}^{2} . \tag{82}
\end{equation*}
$$

Then ineqality (80) induces

$$
\begin{equation*}
\frac{1}{2} \frac{d}{d t}\|\omega\|_{2}^{2}+\|\nabla \omega\|_{2}^{2} \leq \frac{1}{2 E \underline{\omega}}\|\omega\|_{2}^{2} \cdot\|\omega\|_{3}^{3} . \tag{83}
\end{equation*}
$$

Here we use the Gagliardo-Nirenberg inequality (see (4.16) of [19]) in the form of

$$
\begin{equation*}
\|\omega\|_{3}^{3} \leq C\|\omega\|_{H^{1}} \cdot\|\omega\|_{2}^{2}=C\|\omega\|_{2}^{2}\left(\|\nabla \omega\|_{2}+\|\omega\|_{2}\right), \tag{84}
\end{equation*}
$$

to obtain

$$
\begin{align*}
\frac{1}{2} \frac{d}{d t}\|\omega\|_{2}^{2}+\|\nabla \omega\|_{2}^{2} & \leq \frac{C}{E \underline{\omega}}\|\omega\|_{2}^{4}\left(\|\nabla \omega\|_{2}+\|\omega\|_{2}\right) \\
& \leq \frac{1}{2}\|\nabla \omega\|_{2}^{2}+\frac{C^{2}}{8(E \underline{\omega})^{2}}\|\omega\|_{2}^{8}+\frac{C}{2 E \underline{\omega}}\|\omega\|_{2}^{5} \tag{85}
\end{align*}
$$

and hence

$$
\begin{equation*}
\frac{d}{d t}\|\omega\|_{2}^{2}+\|\nabla \omega\|_{2}^{2} \leq \frac{C}{E \underline{\omega}}\|\omega\|_{2}^{5}\left(\frac{C}{E \underline{\omega}}\|\omega\|_{2}^{3}+1\right) \tag{86}
\end{equation*}
$$

Then, Poincaré-Wirtinger's inequality ensures

$$
\begin{equation*}
\frac{d}{d t}\|\omega\|_{2}^{2}+\mu\|\omega\|_{2}^{2} \leq \frac{C}{E \underline{\omega}}\left(\frac{C}{E \underline{\omega}}\|\omega\|_{2}^{6}+\|\omega\|_{2}^{3}\right)\|\omega\|_{2}^{2}, \tag{87}
\end{equation*}
$$

where $\mu=\mu(\Omega)>0$ is a constant.
Writing

$$
\begin{equation*}
y(t)=\frac{C}{E \underline{\omega}}\|\omega\|_{2}^{3}, \tag{88}
\end{equation*}
$$

we obtain

$$
\begin{equation*}
\frac{d}{d t}\|\omega\|_{2}^{2}+\mu\|\omega\|_{2}^{2} \leq\left(y^{2}+y\right)\|\omega\|_{2}^{2} \tag{89}
\end{equation*}
$$

and therefore, if

$$
\begin{equation*}
y^{2}+y<\mu / 2 \tag{90}
\end{equation*}
$$

holds at $t=0$, it keeps to hold that

$$
\begin{equation*}
\frac{d}{d t}\|\omega\|_{2}^{2} \leq 0 \tag{91}
\end{equation*}
$$

and (90) for $0 \leq t<T$. Then, we obtain

$$
\begin{equation*}
\|\omega(\cdot, t)\|_{2} \leq\left\|\omega_{0}\right\|_{2}, \quad 0 \leq t<T, \tag{92}
\end{equation*}
$$

and hence

$$
\begin{equation*}
-\beta(t) \leq \frac{\left\|\omega_{0}\right\|_{2}^{2}}{E \underline{\omega}}=\alpha, \quad 0 \leq t<T \tag{93}
\end{equation*}
$$

by (82).
The condition $y(0)<\frac{\mu}{2}$ means

$$
\begin{equation*}
C_{0}\left\|\omega_{0}\right\|_{2} \leq E \underline{\omega} \tag{94}
\end{equation*}
$$

for $C_{0}>0$ sufficiently large, and hence we obtain the conclusion.
Proof of Theorem 1: By the parabolic regularity, it suffices to show that

$$
\begin{equation*}
\|\omega(\cdot, t)\|_{\infty} \leq C, \quad 0 \leq t<T \tag{95}
\end{equation*}
$$

under the assumption. We have readily shown

$$
\begin{equation*}
\|\omega(\cdot, t)\|_{2} \leq C, \quad 0 \leq-\beta(t) \leq C, \quad 0 \leq t<T \tag{96}
\end{equation*}
$$

by Lemma 3. Then, the conclusion (95) is obtained similarly to (34). See [26] for more details.

In fact, we have

$$
\begin{align*}
\int_{\Omega}\left[\nabla \cdot\left(\omega \nabla^{\perp} \psi\right)\right] \omega^{p} & =-\int_{\Omega} \omega \nabla^{\perp} \psi \cdot \nabla \omega^{p}=-p \int_{\Omega} \omega^{p} \nabla^{\perp} \psi \cdot \nabla \omega \\
& =-\frac{p}{p+1} \int_{\Omega} \nabla^{\perp} \psi \cdot \nabla \omega^{p+1}=\frac{p}{p+1} \int_{\Omega} \omega^{p+1} \nabla \cdot\left(\nabla^{\perp} \psi\right)=0 \tag{97}
\end{align*}
$$

for $p>0$ by (11) and (34). Then it follows that

$$
\begin{align*}
\frac{1}{p+1} \frac{d}{d t} \int_{\Omega} \omega^{p+1}+\frac{4 p}{(p+1)^{2}}\left\|\nabla \omega^{\frac{p+1}{2}}\right\|_{2}^{2} & =-\beta \int_{\Omega} \omega \nabla \psi \cdot \nabla \omega^{p} \\
& =-\beta \cdot \frac{p}{p+1} \int_{\Omega} \nabla \psi \cdot \nabla \omega^{p+1} \leq-\beta \frac{p}{p+1} \int_{\Omega} \omega^{p+1}(-\Delta \psi) \\
& =-\beta \frac{p}{p+1} \int_{\Omega} \omega^{p+1} \leq C \int_{\Omega} \omega^{p+2} \tag{98}
\end{align*}
$$

by $\beta<0$ and (8). Then, Moser's iteration scheme ensures (95) as in [33].

## 4. Proof of Theorem 2

We begin with the following lemma.
Lemma 4 Under the assumption of (22), it holds that

$$
\begin{equation*}
-\beta(t) \geq \delta, \quad 0 \leq t<T, \quad M=\left\|\omega_{0}\right\|_{1}>\frac{8 \pi}{\delta} \Rightarrow T<+\infty \tag{99}
\end{equation*}
$$

in (31), where $\delta>0$ is a constant.

Proof: We have $\omega=\omega(r, t)$ and $\psi=\psi(r, t)$ for $r=|x|$ under the assumption, which implies $\nabla^{\perp} \psi=0$. Then we obtain

$$
\begin{equation*}
\nabla \cdot \omega \nabla^{\perp} \psi=\nabla \omega \cdot \nabla^{\perp} \psi=0 \tag{100}
\end{equation*}
$$

by (17). It holds also that

$$
\begin{align*}
\nabla \cdot(\omega \nabla \psi) & =\nabla \cdot\left(\omega \psi_{r} \frac{x}{r}\right)=\left(\nabla \cdot \frac{x}{r}\right) \omega \psi_{r}+\frac{x}{r} \cdot \nabla\left(\omega \psi_{r}\right) \\
& =\frac{1}{r} \omega \psi_{r}+\left(\omega \psi_{r}\right)_{r}=\frac{1}{r}\left(r \omega \psi_{r}\right)_{r}, \tag{101}
\end{align*}
$$

and therefore, there arises that

$$
\begin{equation*}
\omega_{t}=\frac{1}{r}\left(r \omega_{r}+\beta r \omega \psi_{r}\right)_{r}, \quad \omega_{r}+\left.\beta \omega \psi_{r}\right|_{r=1}=0 . \tag{102}
\end{equation*}
$$

from (31).
Then (102) implies

$$
\begin{align*}
\frac{d}{d t} \int_{0}^{1} \omega r^{3} d r & =\int_{0}^{1} \omega_{t} r^{3} d r=\int_{0}^{1}\left(r \omega_{r}+\beta r \omega \psi_{r}\right)_{r} r^{2} d r \\
& =-\int_{0}^{1} 2 r^{2}\left(\omega_{r}+\beta \omega \psi_{r}\right) d r  \tag{103}\\
& =-\left.2 r^{2} \omega\right|_{r=0} ^{r=1}+\int_{0}^{1} 4 r \omega-2 \beta \omega \psi_{r} r^{2} d r .
\end{align*}
$$

Here we use (50) derived from the Poisson part of (31), that is,

$$
\begin{equation*}
-r \psi_{r}(r, t)=A(r, t) \equiv \int_{0}^{r} s \omega(s, t) d s \tag{104}
\end{equation*}
$$

Putting

$$
\begin{equation*}
\lambda=\int_{0}^{1} \omega r d r=\frac{M}{2 \pi} \tag{105}
\end{equation*}
$$

we obtain

$$
\begin{align*}
\frac{d}{d t} \int_{0}^{1} \omega r^{3} d r & =-\left.2 \omega\right|_{r=1}+4 \lambda+2 \beta \int_{0}^{1} A A_{r} d r \\
& =-\left.2 \omega\right|_{r=1}+4 \lambda+\left.\beta A^{2}\right|_{r=0} ^{r=1}  \tag{106}\\
& =-\left.2 \omega\right|_{r=1}+4 \lambda+\beta \lambda^{2} \\
& <4 \lambda\left(\beta+\frac{M}{8 \pi}\right) \leq 4 \lambda\left(-\delta+\frac{M}{8 \pi}\right)
\end{align*}
$$

Since $-\delta+\frac{M}{8 \pi}<0$, therefore, $T=+\infty$ is impossible, and we obtain $T<+\infty$.
Lemma 5 Under the assumption (22), there is $\delta>0$ such that

$$
\begin{equation*}
\frac{E}{M^{2}}<\delta, \quad \beta(t) \leq 0, \quad 0 \leq t<T \Rightarrow \beta(t) \leq-\frac{1}{C E^{1 / 2}} \quad 0 \leq t<T \tag{107}
\end{equation*}
$$

Proof: First, Lemma 1 implies

$$
\begin{equation*}
\omega \geq\left.\omega_{*} \equiv \omega\right|_{r=1} . \tag{108}
\end{equation*}
$$

Second, we have

$$
\begin{align*}
\int_{\Omega} \nabla \psi \cdot \nabla \omega & =\int_{\partial \Omega} \frac{\partial \psi}{\partial \nu} \omega+\int_{\Omega}(-\Delta \psi) \omega=\omega_{*} \int_{\partial \Omega} \frac{\partial \psi}{\partial \nu}+\|\omega\|_{2}^{2}  \tag{109}\\
& =\omega_{*} \int_{\Omega} \Delta \psi+\|\omega\|_{2}^{2}=\|\omega\|_{2}^{2}-\omega_{*} M
\end{align*}
$$

and hence

$$
\begin{equation*}
-\beta=\frac{\int_{\Omega} \nabla \psi \cdot \nabla \omega}{\int_{\Omega^{2}} \omega|\nabla \psi|^{2}}=\frac{\|\omega\|_{2}^{2}-\omega_{*} M}{\int_{\Omega} \omega|\nabla \psi|^{2}} . \tag{110}
\end{equation*}
$$

Here, we use the Gagliardo-Nirenberg inequality in the form of

$$
\begin{equation*}
\|w\|_{4}^{2} \leq C\|w\|_{2}\|w\|_{H^{1}}, \tag{111}
\end{equation*}
$$

which implies

$$
\begin{align*}
\int_{\Omega} \omega|\nabla \psi|^{2} & \leq\|\omega\|_{2}\|\nabla \psi\|_{4}^{2} \leq C\|\omega\|_{2}\|\nabla \psi\|_{2}\|\nabla \psi\|_{H^{1}}  \tag{112}\\
& \leq C E^{1 / 2}\|\omega\|_{2}^{2}
\end{align*}
$$

by the elliptic estimate of the Poisson equation in (2),

$$
\begin{equation*}
\|\psi\|_{H^{2}} \leq C\|\omega\|_{2} . \tag{113}
\end{equation*}
$$

We have, on the other hand,

$$
\begin{equation*}
\omega_{*} M \leq \frac{M}{E} \int_{\Omega} \omega|\nabla \psi|^{2} \tag{114}
\end{equation*}
$$

by (110), and therefore,

$$
\begin{equation*}
-\beta \geq \frac{1}{C E^{1 / 2}}-\frac{E}{M} \geq \frac{1}{2 C E^{1 / 2}}, \tag{115}
\end{equation*}
$$

provided that

$$
\begin{equation*}
\frac{E}{M^{2}}<\left(\frac{1}{2 C}\right)^{2} \tag{116}
\end{equation*}
$$

Then the conclusion follows.
Proof of Theorem 2: By Lemma 5, there is $\delta_{0}>$ such that

$$
\begin{equation*}
\frac{E}{M^{2}}<\delta \Rightarrow-\beta \geq \frac{1}{C E^{1 / 2}} \equiv \delta_{1} \tag{117}
\end{equation*}
$$

and then, Lemma 4 ensures

$$
\begin{equation*}
M>\frac{8 \pi}{\delta_{1}} \Rightarrow T<+\infty . \tag{118}
\end{equation*}
$$

The assumption in (118) means

$$
\begin{equation*}
\frac{E}{M^{2}}<\left(\frac{1}{8 \pi c}\right)^{2}, \tag{119}
\end{equation*}
$$

and hence we obtain the conclusion.

## Appendix Proof of Theorem 4

This theorem is valid to the general case of $\Omega$ and $\omega_{0}$ without (22). We assume $\delta=1$ without loss of generation, so that

$$
\begin{equation*}
\beta \leq-1 . \tag{120}
\end{equation*}
$$

We follow the argument [27] concerning (34) with the Poisson part replaced by (42) or (43). Thus we have to take case of the vortex term $\nabla \cdot \omega \nabla^{\perp} \psi$, time varying $\beta=\beta(t)$, and the Dirichlet boundary condition in (31).

We recall the cut-off function used in [34] (see also Chapter 5 of [19]). Hence each $x_{0} \in \bar{\Omega}$ and $0<R \leq 1$ admit $\varphi=\varphi_{x_{0}, R} \in C^{2}(\bar{\Omega})$ with

$$
\begin{equation*}
\left.\frac{\partial \varphi}{\partial \nu}\right|_{\partial \Omega}=0, \quad 0 \leq \varphi \leq 1, \quad \varphi=1 \text { in } \Omega \cap B\left(x_{0}, R / 2\right), \quad \varphi=0 \text { in } \Omega \backslash B\left(x_{0}, R\right), \tag{121}
\end{equation*}
$$

and

$$
\begin{equation*}
|\nabla \varphi| \leq C R^{-1} \varphi^{1 / 2}, \quad\left|\nabla^{2} \varphi\right| \leq C R^{-2} \varphi^{1 / 2} \tag{122}
\end{equation*}
$$

In more details, we take a cut-off function, denoted by $\psi$, satisfying (121), using a local conformal mapping, and then put $\varphi=\psi^{4}$.

Let

$$
\begin{equation*}
\varphi \in C^{2}(\bar{\Omega}),\left.\quad \frac{\partial \varphi}{\partial \nu}\right|_{\partial \Omega}=0 . \tag{123}
\end{equation*}
$$

be given. First, we have

$$
\begin{align*}
\frac{d}{d t} \int_{\Omega} \omega \varphi & =\int_{\Omega} \omega \nabla^{\perp} \psi \cdot \nabla \varphi-(\nabla \omega+\beta \omega \nabla \psi) \cdot \nabla \varphi d x  \tag{124}\\
& =\int_{\Omega} \omega \nabla^{\perp} \psi \cdot \nabla \varphi+\omega \Delta \varphi-\beta \omega \nabla \psi \cdot \nabla \varphi d x
\end{align*}
$$

by (11). It holds that

$$
\begin{align*}
\int_{\Omega} \omega \nabla \psi \cdot \nabla \varphi & =\iint_{\Omega \times \Omega} \omega(x, t)\left[\nabla_{x} G\left(x, x^{\prime}\right) \cdot \nabla \varphi(x)\right] \omega\left(x^{\prime}, t\right) d x d x^{\prime} \\
& =\iint_{\Omega \Omega} \omega(x, t) \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)\left[\nabla_{x} G\left(x, x^{\prime}\right) \cdot \nabla \varphi(x)\right] \omega\left(x^{\prime}, t\right) d x d x^{\prime} \\
& +\iint_{\Omega \times \Omega} \omega(x, t)\left(1-\varphi_{x_{0}, 2 R}\left(x^{\prime}\right)\right)\left[\nabla_{x} G\left(x, x^{\prime}\right) \cdot \nabla \varphi(x)\right] \omega\left(x^{\prime}, t\right) d x d x^{\prime} \\
& =I+I I . \tag{125}
\end{align*}
$$

Let, furthermore, $x_{0} \in \Omega$ and $0<R \ll 1$ in the above equality. Then,

$$
\begin{equation*}
\varphi=\left|x-x_{0}\right|^{2} \varphi_{x_{0}, R} \tag{126}
\end{equation*}
$$

satisfies the requirement (123).
It holds that

$$
\begin{equation*}
\nabla \varphi=2\left(x-x_{0}\right) \varphi_{x_{0}, R}+\left|x-x_{0}\right|^{2} \nabla \varphi_{x_{0}, R} \tag{127}
\end{equation*}
$$

and hence

$$
\begin{equation*}
|\nabla \varphi| \leq C\left|x-x_{0}\right|\left(\varphi_{x_{0}, R}+\left|x-x_{0}\right| R^{-1} \varphi_{x_{0}, R}^{1 / 2}\right) \leq C\left|x-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2} . \tag{128}
\end{equation*}
$$

We obtain, furthermore,

$$
\begin{equation*}
\left|x^{\prime}-x_{0}\right| \geq 2 R, \quad\left|x-x_{0}\right| \leq R \Rightarrow\left|x-x^{\prime}\right| \geq R \tag{129}
\end{equation*}
$$

and hence

$$
\begin{equation*}
\left|\nabla_{x} G\left(x, x^{\prime}\right)\right| \leq C R^{-1} \tag{130}
\end{equation*}
$$

in this case. Then it follows that

$$
\begin{equation*}
|I I| \leq C R^{-1} M \int_{\Omega}\left|x-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2} \omega(x, t) d x \leq C R^{-1} M^{3 / 2} A^{1 / 2} \tag{131}
\end{equation*}
$$

where

$$
\begin{equation*}
A=\int_{\Omega}\left|x-x_{0}\right|^{2} \varphi_{x_{0}, R} \omega \tag{132}
\end{equation*}
$$

We have, on the other hand,

$$
\begin{align*}
I & =\iint_{\Omega \times \Omega} \omega(x, t) \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)\left[\nabla_{x} G\left(x, x^{\prime}\right) \cdot \nabla \varphi(x)\right] \omega\left(x^{\prime}, t\right) d x d x^{\prime} \\
& =\frac{1}{2} \iint_{\Omega \Omega}\left[\varphi_{x_{0}, 2 R}\left(x^{\prime}\right) \nabla \varphi(x) \cdot \nabla_{x} G\left(x, x^{\prime}\right)+\varphi_{x_{0}, 2 R}(x) \nabla \varphi\left(x^{\prime}\right) \cdot \nabla_{x^{\prime}} G\left(x, x^{\prime}\right)\right] \omega \otimes \omega \tag{133}
\end{align*}
$$

where $G=G\left(x, x^{\prime}\right)$ is the Green's function to

$$
\begin{equation*}
-\Delta \psi=\omega,\left.\quad \omega\right|_{\partial \Omega}=0 \tag{134}
\end{equation*}
$$

and

$$
\begin{equation*}
\omega \otimes \omega=\omega(x, t) \omega\left(x^{\prime}, t\right) d x d x^{\prime} \tag{135}
\end{equation*}
$$

Here we use the local property of the Green's function

$$
\begin{equation*}
G\left(x, x^{\prime}\right)=\Gamma\left(x-x^{\prime}\right)+K\left(x, x^{\prime}\right), \quad K \in C^{2}(\bar{\Omega} \times \Omega) \cap C^{2}(\Omega \times \bar{\Omega}), \tag{136}
\end{equation*}
$$

where

$$
\begin{equation*}
\Gamma(x)=\frac{1}{2 \pi} \log \frac{1}{|x|} \tag{137}
\end{equation*}
$$

stands for the fundamental solution to $-\Delta$.
Let
$\rho_{x_{0}, R}^{2}\left(x, x()=\varphi_{x_{0}, 2 R}\left(x^{\prime}\right) \nabla \varphi(x) \cdot \nabla_{x} K\left(x, x^{\prime}\right)+\varphi_{x_{0}, 2 R} \nabla \varphi\left(x^{\prime}\right) \cdot \nabla_{x^{\prime}} K\left(x . x^{\prime}\right)\right.$.
Since (128) implies

$$
\begin{align*}
\left|\varphi_{x_{0}, 2 R}\left(x^{\prime}\right) \nabla \varphi(x)\right| & \leq C \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)\left|x-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2}(x)  \tag{139}\\
& \leq C\left|x-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2}(x),
\end{align*}
$$

it holds that

$$
\begin{equation*}
\left|\rho_{x_{0}, R}^{1}\left(x, x^{\prime}\right)\right| \leq C\left(\left|x-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2}(x)+\left|x^{\prime}-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2}\left(x^{\prime}\right)\right) \tag{140}
\end{equation*}
$$

Then, we obtain

$$
\begin{equation*}
I=\frac{1}{2} \iint_{\Omega \times \Omega} \rho_{x_{0}, R}^{0}\left(x, x^{\prime}\right) \omega \otimes \omega+I I I \tag{141}
\end{equation*}
$$

with

$$
\begin{equation*}
|I I| \mid \leq C M^{3 / 2} A^{1 / 2} \leq C R^{-1} M^{3 / 2} A^{1 / 2} \tag{142}
\end{equation*}
$$

where

$$
\begin{equation*}
\rho_{x_{0}, R}^{0}\left(x, x^{\prime}\right)=\nabla \Gamma\left(x-x^{\prime}\right) \cdot\left(\varphi_{x_{0}, 2 R}\left(x^{\prime}\right) \nabla \varphi(x)-\varphi_{x_{0}, 2 R}(x) \nabla \varphi\left(x^{\prime}\right)\right) . \tag{143}
\end{equation*}
$$

Here, we have

$$
\begin{equation*}
\nabla \Gamma(x)=-\frac{x}{2 \pi|x|^{2}} \tag{144}
\end{equation*}
$$

and therefore,

$$
\begin{equation*}
\rho_{x_{0}, R}^{0}\left(x, x^{\prime}\right)=\rho_{x_{0}, R}^{2}\left(x, x^{\prime}\right)+\rho_{x_{0}, R}^{3}\left(x, x^{\prime}\right) \tag{145}
\end{equation*}
$$

fo

$$
\begin{align*}
\rho_{x_{0}, R}^{2}\left(x, x^{\prime}\right) & =-\frac{1}{2 \pi} \frac{x-x^{\prime}}{\left|x-x^{\prime}\right|^{2}} \varphi_{x_{0}, 2 R}\left(x^{\prime}\right) \cdot\left(\nabla \varphi(x)-\nabla \varphi\left(x^{\prime}\right)\right)  \tag{146}\\
\rho_{x_{0}, R}^{3}\left(x, x^{\prime}\right) & =-\frac{1}{2 \pi} \frac{x-x^{\prime}}{\left|x-x^{\prime}\right|^{2}}\left(\varphi_{x_{0}, 2 R}\left(x^{\prime}\right)-\varphi_{x_{0}, 2 R}(x)\right) \cdot \nabla \varphi(x) . \tag{147}
\end{align*}
$$

Since (128) implies

$$
\begin{equation*}
\left|\rho_{x_{0}, R}^{3}\left(x, x^{\prime}\right)\right| \leq C R^{-1}|\nabla \varphi(x)| \leq C R^{-1}\left|x-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2}(x), \tag{148}
\end{equation*}
$$

there arises that

$$
\begin{equation*}
I=\frac{1}{2} \iint_{\Omega \times \Omega} \rho_{x_{0}, R}^{2}\left(x, x^{\prime}\right) \omega \otimes \omega+I V, \tag{149}
\end{equation*}
$$

with

$$
\begin{equation*}
|I V| \leq C R^{-1} M^{3 / 2} A^{1 / 2} \tag{150}
\end{equation*}
$$

similarly.
We have, furthermore,

$$
\begin{align*}
& \nabla \varphi(x)-\nabla \varphi\left(x^{\prime}\right)=2\left(x-x^{\prime}\right) \varphi_{x_{0}, R}(x)+2\left(x^{\prime}-x_{0}\right)\left(\varphi_{x_{0}, R}(x)-\varphi_{x_{0}, R}\left(x^{\prime}\right)\right) \\
& \quad+\left|x^{\prime}-x_{0}\right|^{2}\left(\nabla \varphi_{x_{0}, R}(x)-\nabla \varphi_{x_{0}, R}\left(x^{\prime}\right)\right)+\left(\left|x-x_{0}\right|^{2}-\left|x^{\prime}-x_{0}\right|^{2}\right) \nabla \varphi_{x_{0}, R}(x), \tag{151}
\end{align*}
$$

and hence

$$
\begin{equation*}
\rho_{x_{0}, R}^{2}\left(x, x^{\prime}\right)=-\frac{1}{\pi} \varphi_{x_{0}, 2 R}\left(x^{\prime}\right) \varphi_{x_{0}, R}(x)+\rho_{x_{0}, R}^{4}\left(x, x^{\prime}\right)+\rho_{x_{0}, R}^{5}\left(x, x^{\prime}\right)+\rho_{x_{0}, R}^{6}\left(x, x^{\prime}\right) \tag{152}
\end{equation*}
$$

with

$$
\begin{align*}
\left|\rho_{x_{0}, R}^{4}\left(x, x^{\prime}\right)\right| & \leq C\left|x-x^{\prime}\right|^{-1} \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)\left|x^{\prime}-x_{0} \| \varphi_{x_{0}, R}(x)-\varphi_{x_{0}, R}\left(x^{\prime}\right)\right|  \tag{153}\\
& \leq C R^{-1}\left|x^{\prime}-x_{0}\right| \varphi_{x_{0}, 2 R}\left(x^{\prime}\right), \\
\left|\rho_{x_{0}, R}^{5}\left(x, x^{\prime}\right)\right| & \leq C\left|x-x^{\prime}\right|^{-1} \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)\left|x^{\prime}-x_{0}\right|^{2}\left|\nabla \varphi_{x_{0}, R}(x)-\varphi_{x_{0}, R}\left(x^{\prime}\right)\right| \\
& \leq C R^{-2}\left|x^{\prime}-x_{0}\right|^{2} \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)  \tag{154}\\
& \leq C R^{-1}\left|x^{\prime}-x_{0}\right| \varphi_{x_{0}, 2 R}\left(x^{\prime}\right),
\end{align*}
$$

and

$$
\begin{align*}
\left|\rho_{x_{0}, R}^{6}\left(x, x^{\prime}\right)\right| & \leq C\left|x-x^{\prime}\right| \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)| | x-\left.x_{0}\right|^{2}-\left|x^{\prime}-x_{0}\right|^{2}|\cdot| \nabla \varphi_{x_{0}, R}(x) \mid \\
& \leq C R^{-1}\left(\left|x-x_{0}\right|+\left|x^{\prime}-x_{0}\right|\right) \varphi_{x_{0}, R}(x) \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)  \tag{155}\\
& \leq C\left(R^{-1}\left|x-x_{0}\right| \varphi_{x_{0}, R}(x)+R^{-1}\left|x^{\prime}-x_{0}\right| \varphi_{x_{0}, 2 R}\left(x^{\prime}\right)\right)
\end{align*}
$$

by

$$
\begin{equation*}
\left|\left|x-x_{0}\right|^{2}-\left|x^{\prime}-x_{0}\right|^{2}\right|=\left|\left(x-x^{\prime}, x+x^{\prime}-2 x_{0}\right)\right| \leq\left|x-x^{\prime}\right|\left(\left|x-x_{0}\right|+\left|x^{\prime}-x_{0}\right|\right) . \tag{156}
\end{equation*}
$$

The residual terms are thus treated similarly, and it follows that

$$
\begin{equation*}
\left|I+\frac{1}{2 \pi} \int_{\Omega} \omega \varphi_{x_{0}, R} \cdot \int_{\Omega} \omega \varphi_{x_{0}, 2 R}\right| \leq C R^{-1} M^{3 / 2} A^{1 / 2}, \tag{157}
\end{equation*}
$$

which results in

$$
\begin{equation*}
\left|\int_{\Omega} \omega \nabla \psi \cdot \nabla \varphi+\frac{1}{2 \pi} \int_{\Omega} \omega \varphi_{x_{0}, R} \cdot \int_{\Omega} \omega \varphi_{x_{0}, 2 R}\right| \leq C R^{-1} M^{3 / 2} A^{1 / 2} \tag{158}
\end{equation*}
$$

We can argue similarly to the vortex term in (124). This time, from

$$
\begin{equation*}
\nabla^{\perp} \Gamma(x) \cdot x=0 \tag{159}
\end{equation*}
$$

it follows that

$$
\begin{equation*}
\left|\int_{\Omega} \omega \nabla^{\perp} \psi \cdot \nabla \varphi\right| \leq C R^{-1} M^{3 / 2} A^{1 / 2} \tag{160}
\end{equation*}
$$

Concerning the principal term of (124), we use

$$
\begin{equation*}
\Delta \varphi=4 \varphi_{x_{0}, R}+4\left(x-x_{0}\right) \cdot \nabla \varphi_{x_{0}, R}+\left|x-x_{0}\right|^{2} \Delta \varphi_{x_{0}, R} \tag{161}
\end{equation*}
$$

From

$$
\begin{equation*}
\left|\left(x-x_{0}\right) \cdot \nabla \varphi_{x_{0}, R}\right| \leq C R^{-1}\left|x-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2} \tag{162}
\end{equation*}
$$

and

$$
\begin{align*}
\left|\left|-x_{0}\right|^{2} \Delta \varphi_{x_{0}, R}\right| & \leq C R^{-2}\left|x-x_{0}\right|^{2} \varphi_{x_{0}, R}^{1 / 2}  \tag{163}\\
& \leq C R^{-1}\left|x-x_{0}\right| \varphi_{x_{0}, R}^{1 / 2},
\end{align*}
$$

it follows that

$$
\begin{align*}
\left|\int_{\Omega} \omega \Delta \varphi-4 \int_{\Omega} \omega \varphi_{x_{0}, R}\right| & \leq C \int_{\Omega} R^{-1}\left|x-x_{0}\right| \varphi_{x_{0}, R} \omega  \tag{164}\\
& \leq C R^{-1} M^{1 / 2} A^{1 / 2} .
\end{align*}
$$

Let $M_{1}=M_{x_{0}, R}$ and $M_{2}=M_{x_{0}, 2 R}$ for

$$
\begin{equation*}
M_{x_{0}, R}=\int_{\Omega} \omega \varphi_{x_{0}, R} \tag{165}
\end{equation*}
$$

Then, using (120), we end up with

$$
\begin{equation*}
\frac{d A}{d t} \leq 4 M_{1}-\frac{M_{1}^{2}}{2 \pi}+C R^{-1}\left(M^{3 / 2}+M^{1 / 2}\right) A^{1 / 2}+C\left(M_{2}-M_{1}\right) \tag{166}
\end{equation*}
$$

Inequalilty (166) implies $T<+\infty$ if $A(0) \ll 1$, as is observed by [27] (see also Chapter 5 of [19]). Here we describe the proof for completeness.

The first observation is the monotoniity formula

$$
\begin{equation*}
\left|\frac{d}{d t} \int_{\Omega} \omega \varphi\right| \leq C\left(M+M^{2}\right)\|\nabla \varphi\|_{C^{1}}, \tag{167}
\end{equation*}
$$

derived from (124) and the symmetry of the Green's function: $G\left(x, x^{\prime}\right)=$ $G\left(x^{\prime}, x\right)$. The proof is the same as in (34) and is omitted.

Second, we put $I_{1}=I_{x_{0}, R}$ and $I_{2}=I_{x_{0}, 2 R}$ for

$$
\begin{equation*}
I_{x_{0}, R}=\int_{\Omega}\left|x-x_{0}\right|^{2} \omega \varphi_{x_{0}, R} \tag{168}
\end{equation*}
$$

Then it holds that

$$
\begin{align*}
M_{2}-M_{1} & \leq \int_{R<\left|x-x_{0}\right|<2 R} \varphi_{x_{0}, 2 R} \omega  \tag{169}\\
& \leq 2 R^{-1} \int_{\Omega}\left|x-x_{0}\right| \varphi_{x_{0}, 2 R} \omega \leq 2 M^{1 / 2} R^{-1} I_{2}^{1 / 2}
\end{align*}
$$

and

$$
\begin{align*}
A_{2} & =A_{1}+\int_{\Omega}\left|x-x_{0}\right|^{2}\left(\varphi_{x_{0}, 2 R}-\varphi_{x_{0}, R}\right) \omega \\
& \leq A_{1}+4 R^{2} \int_{\Omega}\left(\varphi_{x_{0}, 2 R}-\varphi_{x_{0}, R}\right) \omega \tag{170}
\end{align*}
$$

which implies

$$
\begin{align*}
\frac{d A_{1}}{d t} & \leq 4 M_{1}-\frac{M_{1}^{2}}{2 \pi}+C R^{-1}\left(M^{3 / 2}+M^{1 / 2}\right) A_{1}^{1 / 2} \\
& +C\left(M^{3 / 2}+M^{1 / 2}\right)\left\{\int_{\Omega}\left(\varphi_{x_{0}, 2 R}-\varphi_{x_{0}, R}\right) \omega\right\}^{1 / 2} \tag{171}
\end{align*}
$$

Here, we use (167) to ensure

$$
\begin{equation*}
\left\lvert\, \frac{d}{d t}\left(\left.4 M_{1}-\frac{M^{2}}{2 \pi} \right\rvert\, \leq C\left(M+M^{2}\right) R^{-2}\right.\right. \tag{172}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|\frac{d}{d t} \int_{\Omega}\left(\varphi_{x_{0}, 2 R}-\varphi_{x_{0}, R}\right) \omega\right| \leq C\left(M+M^{2}\right) R^{-2} . \tag{173}
\end{equation*}
$$

Then, it follows that

$$
\begin{equation*}
4 M_{1}-\frac{M_{1}^{2}}{2 \pi} \leq 4 M_{1}(0)-\frac{M_{1}(0)^{2}}{2 \pi}+\operatorname{CBa}\left(R^{-1} t^{1 / 2}\right) \tag{174}
\end{equation*}
$$

and

$$
\begin{align*}
\int_{\Omega}\left(\varphi_{x_{0}, 2 R}-\varphi_{x_{0}, R}\right) \omega & \leq \int_{\Omega}\left(\varphi_{x_{0}, 2 R}-\varphi_{x_{0}, R}\right) \omega_{0}+C B a\left(R^{-1} t^{1 / 2}\right)  \tag{175}\\
& \leq 2 R^{-2} A_{2}(0)+\operatorname{CBa}\left(R^{-1} t^{1 / 2}\right)
\end{align*}
$$

for

$$
\begin{equation*}
B=M^{3 / 2}+M^{1 / 2}, \quad a(s)=s^{2}+s \tag{176}
\end{equation*}
$$

Thus we obtain

$$
\begin{align*}
\frac{d A_{1}}{d t} & \leq 4 M_{1}(0)-\frac{M_{1}(0)^{2}}{2 \pi}+C R^{-1} B A_{1}^{1 / 2}+C B A_{2}(0)^{1 / 2}+C B a\left(R^{-1} t^{1 / 2}\right)  \tag{177}\\
& =J(0)+C B a\left(R^{-1} t^{1 / 2}\right)+C B R^{-1} A_{1}^{1 / 2}
\end{align*}
$$

for

$$
\begin{equation*}
J=4 M_{1}-\frac{M_{1}^{2}}{4 \pi}+C B R^{-1} A_{2}^{1 / 2} \tag{178}
\end{equation*}
$$

Assume $M_{1}(0)>8 \pi$, and put

$$
\begin{equation*}
-4 \delta=4 M_{1}(0)-\frac{M_{1}(0)^{2}}{2 \pi}<0 \tag{179}
\end{equation*}
$$

Let, furthemore,

$$
\begin{equation*}
\frac{1}{R^{2}} \int_{\Omega}\left|x-x_{0}\right|^{2} \varphi_{x_{0}, 2 R} \omega_{0} \leq \eta . \tag{180}
\end{equation*}
$$

Now we define $s_{0}$ by

$$
\begin{equation*}
C B a\left(s_{0}\right)=\delta \tag{181}
\end{equation*}
$$

in (177), and take $0<\eta \ll 1$ such that

$$
\begin{equation*}
\eta \leq \delta s_{0}^{2} \tag{182}
\end{equation*}
$$

Then, if $R$ and $T_{0}$ satisfy $R^{-2} T_{0}=\eta \delta^{-1}$, it holds that

$$
\begin{equation*}
A_{1}(0) \leq R^{2} \eta<2 \delta T_{0} \tag{183}
\end{equation*}
$$

Making $0<\eta \ll 1$, furthermore, we may assume

$$
\begin{align*}
J(0)+C B R^{-1} A_{1}(0)^{1 / 2} & \leq-4 \delta+C B R^{-1} A_{2}(0)^{1 / 2}  \tag{184}\\
& \leq-4 \delta+C B \eta^{1 / 2} \leq-3 \delta
\end{align*}
$$

which results in

$$
\begin{align*}
\frac{d A_{1}}{d t} & \leq J(0)+C B a\left(R^{-1} T_{0}^{1 / 2}\right)+B R^{-1} A_{1}(t)^{1 / 2} \\
& =J(0)+\delta+C B R^{-1} A_{1}^{1 / 2}, \quad 0 \leq t<T_{0} \tag{185}
\end{align*}
$$

provided that $T \geq T_{0}$.
A continuation argument to (184)-(185) guarantees

$$
\begin{equation*}
\frac{d A_{1}}{d t} \leq-2 \delta, \quad 0 \leq t<T_{0} \tag{186}
\end{equation*}
$$

and then we obtain

$$
\begin{equation*}
A_{1}\left(T_{0}\right) \leq A_{1}(0)-2 \delta T_{0}<0 \tag{187}
\end{equation*}
$$

by (183), a contradiction.
