Natural Products for Salmonellosis: Last Decade Research

Nancy Jannet Ruiz-Pérez, Jaime Sánchez-Navarrete
and Julia D. Toscano-Garibay

Abstract

Salmonellosis is a disease of great relevance in terms of public health given the economic and social impact that causes both in developing and highly industrialized countries. Due to its transmission mechanism, it affects hundreds or thousands of people every year and is considered an acute disease of worldwide distribution. Causative agent of salmonellosis is *salmonella* specie which are small gram-negative bacilli and facultative intracellular pathogen of the Enterobacteriaceae family. Multidrug resistance is reported more frequently in strains of *salmonella*, raising the necessity of new strategies to combat its spread and to treat the disease. Natural products (NPs) derived from traditional medicine knowledge have become an important resource to this end. In this chapter, we present a summary of information published from 2010 to 2020, as a sample of the potentiality of NPs as agents for Salmonellosis. This search was not exhaustive, rather, we aim to obtain a random sample of information using the simplest terms on the matter of natural products for salmonellosis, hopefully, as a reference source for interested researchers.

Keywords: *salmonella*, antibacterial activity, natural products, anti-salmonella, Salmonellosis

1. Introduction

Salmonellosis is a disease of great relevance in terms of public health given the economic and social impact that causes both in developing and highly industrialized countries. Due to its transmission mechanism, it affects hundreds or thousands of people every year and is considered an acute disease of worldwide distribution [1] with variations in the frequency of serotypes from one country to another [2], being notably more frequent in areas that have not reached adequate sanitation and hygiene conditions or that do not have enough resources and public health infrastructure. There is no distinction in the occurrence of salmonellosis by sex, age, or social and economic status with high incidence at the extremes of life, being the most vulnerable groups, children under 5yo, adults over 60 years of age and immunocompromised individuals [3, 4]. On the other hand, it is also a seasonal disease, so incidence is higher on periods of increased environmental temperature like spring and summer, showing a decrease in autumn and winter [5].

The raise in salmonellosis at any part of the world is of maximum relevance. For example, an incidence of 0.78–3.8 million cases per year has been estimated in the United States. Natural reservoir is made up of domestic animals (dogs and cats), wild animals (reptiles such as iguanas and turtles) as well as humans (carriers, convalescent). Transmission is through food (with or without manufacture) and water contaminated with human or animal feces and from individual to individual. Salmonellosis presents as sporadic cases or as outbreaks with variable affectations. Incidence rate is dose-dependent in function of the disseminated serotype and is determined by incubation period, symptoms and severity.

Causative agent of salmonellosis are *salmonella* species, numerous disease outbreaks are related to the consumption of eggs, chicken meat and other raw products (mainly dairy). For instance, in an outbreak of enteric salmonellosis serotype Typhimurium (n = 99) induced by consumption of roast porcine meat in an institution for the mentally ill in Konagua it was shown that the incubation period was between 10–12 hours and that the supply of antibiotics prolonged excreta periods. Salmonellosis due to *Salmonella enterica* serotype Enteritidis was detected in an inter-state outbreak in the United States in the early 90's, produced by the consumption of ice cream (224,000 cases) and in Canada due to the consumption of commercial packaged cheese (800 cases). *Salmonella Javiana* (n = 66) has been reported to produce outbreaks as in Boston due to the consumption of chicken sandwiches [6].

2. *Salmonella*

Salmonella belongs to the Enterobacteriaceae family, which are small gram-negative bacilli varying in sizes ranging in average from 2–3 µm in length and 0.4–0.6 µm in width. These bacilli do not form spores and possess peritrichous flagella hence are mobile microorganisms, although some genera, such as *Klebsiella* and *Shigella*, are lacking on these organelles and so on mobility. Traditional grouping classification is carried out using primary biochemical characteristics that allows a further sorting into subgroups based on antigenic structure determinants or using bacteriophage reactions. Currently, with the advances in molecular biology, the differentiation of groups and subgroups can be made using PCR technique for identification, diagnostic and epidemiological purposes.

Regarding its metabolic characteristics, *salmonella* grows in simple synthetic media and can use unique carbon sources, such as glucose in a fermentative way with the subsequent formation of acids and/or gases, reducing nitrates and nitrites, rendering oxidase negative reaction. *Salmonella* also tests positive for methyl red, hydrogen sulfide, indole-ornithine motility (MIO medium), lysine decarboxylase, arginine dihydrolase, ornithine decarboxylase, gas from glucose, and fermentation of numerous carbohydrates such as rhamnose, arabinose, mannitol, etc.

Most enteric microorganisms are resistant to inhibition by the action of certain bacteriostatic dyes, the selective media containing these compounds facilitate considerably isolation from fecal samples, *salmonella* is less sensitive than coliform microorganisms against citrate inhibition action; for instance, SS (*Salmonella-Shigella*) agar containing both citrate and bile salts is therefore used as a selective medium for the culture of pathogenic species [7, 8].

3. Classification

Although controversial and evolving, there is a *salmonella* nomenclature used by the Centers for Disease Control and Prevention (CDC) and recommended by the

Collaborating Center of the World Health Organization (WHO), which according to the differences in their 16S rRNA sequence analysis classifies this genus into two species, *Salmonella enterica* and *Salmonella bongori*. *S. enterica* can also be further classified into six subspecies mainly found in mammals and is responsible for 99% of infections in humans and warm-blooded animals. On the other hand, *S. bongori* is predominantly environmental and on cold-blooded animals [9].

3.1 Classification according to Kauffmann-White

Since decades ago, classification of *salmonella* finalizing at the species level are based on its antigenic structure. Although certain strains that have the same antigenic activity could present different metabolic reactions (biotype variants or serotypes), this sorting method is generally accepted and is actively in use.

Surface antigen studies are based on H, O, K and Vi antigens. H is denominated surface or flagellar antigen and participates in host immune response, O (aka somatic antigen) is a lipopolysaccharide located in the cell membrane, K is a capsular antigen and Vi antigen is a subtype of K antigen associated to virulence [9] and the obtention of antisera containing antibodies against all these fractions allows the identification of *salmonella* species. More than 2,500 serotypes have been identified related to the H, O, K and Vi antigens [10] as a result of the numerous absorption tests and cross-reactions studies carried out in Denmark and England by Kauffman and White. Currently, large centers in Copenhagen, London, and Atlanta have the necessary collections of specific antisera for salmonellas typing. In most testing and diagnostic laboratories, *salmonella* strains are identified and classified by their fermentative characteristics and agglutination reactions using group-specific antisera.

In Mexico, for example, a study for the classification and identification of *salmonella* serotypes at public and private health centers and hospitals analyzed 24,394 *salmonella* strains isolated from different sources, 15,843 (64.9%) of human origin and 8,551 (35.1%) non-human demonstrating the usefulness of Kauffmann-White scheme and using antisera produced at the National Institute of Diagnosis and Reference (INDRE) in accordance with the Center for Disease Control and Prevention, Atlanta (GA), showing that most frequent serotypes both in human and non-human samples were *S. Typhimurium*, *S. Enteritidis*, *S. Derby*, *S. Agona* and *S. Anatum*. From the epidemiological point of view, it is interesting to identify which are the circulating and emerging serotypes to implement prevention strategies [8].

4. Pathogenicity

Salmonella spp. is a highly pathogenic microorganism that presents different pathogenicity mechanisms including adherence, invasiveness, colonization and growth, toxicity and tissue damage [11]. It is a facultative intracellular pathogen causing moderate to severe infections, or even compromising systemic infections risking patients' lives, depending on the serotype, virulence, inoculum and immunological state of involved host, and all of this using only a mixture of toxins and other virulence factors.

Clinical manifestations in humans include enteric fevers, acute gastroenteritis and septicemia in extreme cases. Prototypical enteric fevers are caused by *Salmonella* Typhi, this is also known as typhoid fever, after its incubation period (7–14 days), symptoms such as anorexia, headache, followed by general malaise and fever may occur. The interaction patient-causative agent is essential for the progression of the disease, *salmonella* must find a microhabitat suitable for its establishment, multiplication and virulence factors expression.

Salmonella produces at least three toxins: enterotoxin, lipopolysaccharide endotoxin (LPS), and cytotoxin. Enterotoxigenicity, which is a property present in many serotypes of this microorganism, including *S. Typhi*, is expressed a few hours after contact with the host cell. The pathogenicity mechanisms by which *salmonella* induces diarrhea and septicemia have not yet been clearly elucidated, but it appears to be a complex phenomenon involving numerous virulence factors such as those mentioned above.

The specific virulence factors are encoded by a group of genes for the formation of pathogenicity islands (SPI), with G + C percentages differing from the average of the bacterial genome. Direct repeats are present at the filament ends, carrying genes that encode mobility factors such as integrases, transposases or insertion sequences and are frequently inserted on tRNA. This suggests that they have been obtained from other species by horizontal transfer or by plasmids. There are numerous genes that participate in the invasion and that are present in salmonellas, genes that code for the synthesis of proteins related to the translocation of effector molecules within the cytoplasm of the host cell. Today, it is known that *salmonella* has five islands of pathogenicity: SPI-1, SPI-2, SPI-3, SPI-4 and SPI-5 [10].

5. Mechanisms of resistance

Drug resistance and worldwide incidence of *salmonella* infections has been increasingly reported. For example, it has been observed a high incidence among humans, livestock and poultry of *Salmonella enterica* serotype [4, [5],12:i:-], with variants ranging from sensitive- to multi-drug resistant, since the 1990s. Other examples include a strain of *Salmonella enterica* discovered on 2015 that was provided with the gene *mcr-1* of plasmid-mediated colistin resistance and clinical isolates from Portugal, China and United Kingdom observed in 2016 with this same gene [12].

Several types of *salmonella* with multi-drug resistance (MDR) are capable of generating diverse types of plasmids, with gene cassettes that provide the property of resistance against antibiotics such as chloramphenicol, tetracycline, ampicillin, and streptomycin [13, 14]. The chromosomal mutation in the regions that determine the resistance to quinolones of the *gyrA* gene are responsible for the appearance of *salmonella* serotypes with little susceptibility to ciprofloxacin [15]. On the other hand, the mutated genes that code for extended spectrum β -lactamases, are responsible for the serotypes that have begun to develop resistance to cephalosporins [16].

Resistance not only by *salmonella*, but by other microorganisms are currently a public health problem worldwide, which threatens the prevention, control and treatment of innumerable infectious diseases, having as expected consequences in terms of health and economic impact. This problem was recognized by the World Health Organization and in 2001 this organization published the Global Strategy for the Containment of Antimicrobial Resistance, publicizing interventionist actions to delay the appearance and to reduce the spread of resistant microorganisms [17]. For 2012, WHO proposed a series of actions such as strengthening health services and epidemiological surveillance, regulated use of antimicrobials in hospitals and in communities, promoting the development of new drugs and appropriate vaccines, among others [18]. This problem is one of the reasons for the development of new alternatives, being natural products derived from traditional medicine, one of the most used resources.

6. Traditional medicine and natural products

The origin of Natural and Traditional Medicine is indisputably linked both to human history and to its fight for survival [19]. Written evidence on plants being

used as remedies for disease is as ancient as Mesopotamian tablets, and from there, a nearly endless number of registers in all cultures, supports its essential role on human well-being. Currently, traditional medicine has been delineated as the use of products of natural origin for health preservation, having the so-called Natural Products (NPs) at its focus.

NPs are broadly defined as small molecules produced by a living organism. This definition comprises a wide variety of compounds including the synthesized during basic metabolism (primary metabolites) or as by-products of it (secondary metabolites). Lipids, carbohydrates, proteins and nucleic acids are part of the first kind of NPs, while smaller molecules such as alkaloids, tannins, saponins and flavonoids are examples of secondary metabolites. Many of the latter does not seem to have a metabolic or evolutionary function for the parental organism, but regardless to that, its utility as drugs, preservatives, dyes, food additives and/or antibiotics is undeniable. Its application to counteract the pathogenic microorganisms affecting our specie, alongside side-effects and resistance to antibacterial drugs, is undoubtedly enough motivation for the current formalization and systematization of traditional knowledge, with methodological studies being carried out very frequently nowadays.

There has been an important upturn in the study of compounds of natural origin during the last decade, supported on ethnopharmacological information, folkloric reputation, traditional uses and the existence of previous evidence, and also based on NPs chemical composition and its chemotaxonomic classification. This explosion of information has been enriched primarily through the obtention and separation of crude extracts, essential oils, and/or other types of preparations that are subsequently analyzed for possible biological activities of metabolites or secondary products. Modern experimental strategies have included bioassays (mainly in vitro), development of NP libraries, production of active compounds in cell or tissue cultures, genetic manipulation of organisms, natural combinatorial chemistry, etc. [20]. NPs, being originated in living organisms, are essentially complex mixtures contained within cellular structures, hence the first step into the study of its properties is the separation of such structures. This first step is called extraction, and is generally carried out by liquid solvents at room temperature and atmospheric pressure, along with other well-known and widely used techniques such as steam distillation and the use of supercritical fluids or pressurized gases [21]. The proper choice of an extraction step is necessarily based on the nature, origin and composition of the product to be studied, taking into account the characteristics of the possible solvents (innokenty, reactivity, etc.), toxicity of secondary products, product sufficiency needs and evaluation methods to be followed afterwards, as a whole this step should result suitable to fulfill the objective of a research. Second and third steps are the setting of an adequate model for biological efficacy assessment and the elucidation of individual bioactive components.

In this chapter, we enlisted natural products frequently reported against *salmonella* from bacteria (**Table 1**), fungus (**Table 2**), animal (**Table 3**), plant (**Table 4**) or combined (**Table 5**) origin, organized on a chronologically descending order according to publishing date. To get a glimpse on the universe of information that NPs research has become, we made a fast search on two commonly used and easily accessible databases (PubMed and Google scholar) for the terms: *salmonella*, *anti-salmonella*, *salmonellosis*, *natural product* and *antibacterial activity*, alone or in combinations. Search results without the terms *salmonella* or *salmonellosis* were excluded. From the remaining registers, we selected those corresponding to experimental reports where the extraction step was performed and thoroughly described by authors. Studies on isolated or synthetic NPs were not included and research on infection or tissue damage protection after *salmonella* colonization were also excluded. Review articles or abstracts were not considered, although we accounted

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	Salmonella serovar	Year	Ref
Lactobacillus plantarum ZJ316	Bacteria	culture supernatant filtration (methanol/ acetonitrile)	bacilli	L-phenyl lactic acid	China	Salmonella Paratyphi-A (CMCC 50093), Salmonella Paratyphi-B (CMCC 50094), Salmonella enterica subsp. enterica (ATCC 14028), Salmonella enterica subsp. arizonae (CMCC(B) 47001), Salmonella choleraesuis (ATCC 13312), and Salmonella Typhimurium (CMCC 50015)	2020	[22]

Typhi</i> (collection), <i>S. Typhimurium</i> and <i>S. Enteritidis</i> (clinical isolates)	2020	[65]
<i>Ziziphus lotus</i> and <i>Ziziphus mauritianas</i>	Plant	methanolic extracts	leaves, fruits and seeds	Quinic acid, p-coumaric acid, rutin and quercitrin	Tunisia	<i>Salmonella</i> Typhimurium (NRLB4420)	2020	[66]
<i>Rhododendron arboreum</i> and <i>Justicia adhatoda</i>	Plant	ethanolic and methanolic extracts	leaves	oleanadien-3 β -ethan-3-oate	Nepal	<i>Salmonella enterica</i> subsp. <i>enterica</i> (ATCC 13076)	2020	[67]
<i>Uvaria chamae</i> , <i>Lantana camara</i> and <i>Phyllanthus amarus</i>	Plant	aqueous and ethanolic extracts	leaves and root	not specified	Benin	<i>Salmonella</i> Typhimurium ATCC 14028 and <i>Salmonella</i> spp. (isolates)	2020	[68]
<i>Vitis vinifera</i> var. Albariño	Plant	hydro-organic extraction (patented)	fruit	HOL: catechin, epicate-chin and isoquercetin. HOP: phologlucinic acid, miquelianin, rutin, inkaempferol and caftaric acid	Spain	<i>Salmonella enterica</i> subsp. <i>enterica</i> (CECT 554)	2020	[69]
<i>Citrus hystrix</i>	Plant	ethanolic extract	peel	not specified	Indonesia	<i>Salmonella</i> Typhimurium	2020	[70]
Olive oil	Plant	ethanolic extract	fruit	polyphenol extracts	China	<i>Salmonella</i> Typhimurium (ATCC 14028)	2020	[71]
<i>Agrimonia pilosa</i> Ledeb, <i>Iris domestica</i> (L.) Goldblatt and Mabb, <i>Anemone chinensis</i> Bunge,	Plant	aqueous extracts	herb, rhizome, root and tuber	not specified	China	<i>Salmonella</i> Enteritidis (NCTC 0074, 1F6144, LE103 and QA04/19)	2020	[72]
<i>Litsea cubeba</i>	Plant	essential oil	fruit	2,6-octadienal, 3,7-dimethyl-, 2,6-octadien-1-ol, 3,7-dimethyl-, and Z-2,6-octadien-1-ol, 3,7-dimethyl, Z-2,6-Octadienal, 3,7-dimethyl-, Z-citral	China	<i>Salmonella enterica</i> (CGMCC 1.755)	2020	[73]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	Salmonella serovar	Year	Ref
<i>Quercus infectoria</i> , <i>Phyllanthus emblica</i>	Plant	aqueous, methanolic and ethanolic extracts	gall, fruit	hexadecanoic acid, 9-octadecenoic acid, octadecenoic acid, 2-tert butyl-4-isopropyl-5 methylphenol	India	<i>Salmonella</i> Enteritidis and <i>Salmonella</i> Typhi	2020	[74]
<i>Capparis decidua</i>	Plant	methanolic extract	whole plant	not specified	Pakistan	<i>Salmonella</i> Typhi	2020	[75]
<i>Detarium microcarpum</i> Guill. & Perr.	Plant	ethanolic extract	leaves, twigs, roots, and root bark	flavonoids, sterols, triterpenes, glucosides, coumarins, and saponins	Cameroon	<i>Salmonella</i> Typhi (ATCC 19430), <i>Salmonella</i> Enteritidis (ATCC 13076)	2020	[76]
<i>Tetrapleura tetraptera</i>	Plant	ethanolic extract	stem	citral, acetic acid, limonene, butanol, 2-hydroxyl-3 butanone, Cis-Verbenol Trans-Verbenol, α -Terpinyl acetate, butanoic acid, 2-methyl butanol	Ghana	<i>Salmonella</i> Enteritidis (CICC 21482) and <i>Salmonella</i> Typhimurium (CICC 21483)	2020	[77]
<i>Ocimum gratissimum</i>	Plant	aqueous and ethanolic extracts	leaves	alkaloid, tannins, oxalate, flavonoids and essential oil	Nigeria	<i>Samonella</i> Typhi and <i>Salmonella</i> ParaTyphi (clinical isolates)	2019	[78]
<i>Aeollanthus pubescens</i>	Plant	essential oil (aqueous)	leaves	thymol and carvacrol (anti-radical activity)	Nigeria	<i>Salmonella</i> spp. (multidrug resistant isolate)	2019	[79]
<i>Annona muricata</i> L.	Plant	ethanol extracts	flower	secondary metabolites such as alkaloids, phenolic and flavonoid	Indonesia	<i>Salmonella</i> Enteritidis	2019	[80]
<i>Rhodomyrtus tomentosa</i> (Ait) Hassk	Plant	N-hexane, ethyl acetate, ethanol	leaves	phenols and flavonoids	Indonesia	<i>Salmonella</i> Typhi	2019	[81]
<i>Morinda lucida</i>	Plant	acetone and aqueous extracts	leaves	not specified	South africa	<i>Salmonella enterica</i> subsp. <i>enterica</i> including <i>S. enterica</i> serovar Gallinarum, Dublin, choleraesuis, Braenderup, Idikan, Kottbus, Typhimurium and Enteritidis	2019	[82]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	<i>Salmonella</i> serovar	Year	Ref
<i>Zanthoxylum acanthopodium</i> DC (andaliman)	Plant	ethanol extracts	fruit	saponin, tannin, steroid and alkaloid	Indonesia	<i>Salmonella</i> Typhi	2019	[83]
<i>Physalis peruviana</i> L	Plant	ethanol extracts	berries and leaves	Phenolic compounds (1-hexanol, eucalyptol and 4-terpenol)	Ecuador	<i>Salmonella</i> spp. (clinical isolates)	2019	[84]
<i>Carica papaya</i> L.	Plant	70% ethanol, followed by n-hexane, ethyl acetate and water	seeds	alkaloids, flavonoids, terpenoids and saponins	Indonesia	<i>Salmonella</i> Typhi (ATCC 1408)	2019	[85]
<i>Psidium guajava</i>	Plant	methanol and aqueous extracts	leaves and stem bark	alkaloid, saponin, phenol, flavonoids, glycoside, anthraquinones, terpenoid and tannin	Nigeria	<i>Salmonella</i> Typhi (clinical isolates)	2019	[86]
<i>Artocarpus heterophyllus</i> . Lamk.	Plant	ethanol extracts	leaves	Saponin, flavonoids, terpenoid/steroids and tannin	Indonesia	<i>Salmonella</i> Typhi	2019	[87]
<i>Sesbiana grandiflora</i> L. Press	Plant	90% ethanol followed by n-hexane, ethyl acetate and aqueous extraction	leaves	Saponin, flavonoids, terpenoid, alkaloids and tannin	Indonesia	<i>Salmonella</i> Typhi	2020	[88]
<i>Myristica fragrans</i>	Plant	aqueous extract	seeds	methane, oxybis [dichloro-, 1H-Cyclopenta [c] furan-3-(3aH)-one,6,6a-dihydro-1-(1,3-dioxolan-2-yl)-, (3aR, 1-t, Octadecane, 6-methyl-, Heptadecane, 2,6,10,14-tetramethyl-, BIS (2-Ethylhexyl) phthalate, 4H-Pyran-4-one,2,3-dihydro-3,5-dihydroxy- 6-methyl-, 3,4-Dichlorophenethylamine and 1,4-Benzenediol, 2-bromo-	India	MDR <i>Salmonella</i> Typhi isolates (MCASMZU1–13)	2020	[89]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	Salmonella serovar	Year	Ref
<i>Kalanchoe brasiliensis</i> Cambess.	Plant	hydroethanolic extract	leaves	flavones and flavonols (3-hydroxyflavones or flavonols with substituted 3-hydroxyl groups (methylated or glycosylated))	Brazil	<i>Salmonella</i> Gastroenteritis	2019	[90]
White mustard	Plant	essential oil	essential oil	not specified. Synergic with carvacrol and thymol	USA	<i>Salmonella</i> Typhimurium	2019	[91]
<i>Quercus variabilis</i> Blume	Plant	70% ethanol followed by petroleum ether, ethyl acetate, n-butanol and water	valonia and shell	ellagic acid, theophylline, caffeic acid and tannin acid	China	<i>Salmonella</i> Paratyphi A, <i>Salmonella</i> Typhimurium and <i>Salmonella</i> Enteritidis	2019	[92]
<i>Melia azedarach</i>	Plant	ethanol, ethylacetate, hexane, dichloromethane and methanol extracts	leaves	not specified	Syria	<i>Salmonella</i> Typhi	2019	[93]
Ocotea minarum	Plant	80% ethanol followed by hexane and ethyl acetate	leaves and stem bark	caffeic acid, p-coumaric acid, rosmarinic acid, quercetin and luteolin	Brazil	<i>Salmonella</i> Typhimurium (14028), <i>Salmonella</i> Enteritidis (13076)	2019	[94]
<i>Zingiber zerumbet</i>	Plant	ethanolic extract	rhizome	Alkaloids, terpenoids, and tannins	Indonesia	<i>S. Enteritidis</i> (ATCC 31194) and <i>Salmonella</i> Typhimurium (ATCC 23564)	2019	[95]
<i>Annona muricata</i>	Plant	ethanolic extract	leaves	flavonoids, alkaloids, terpenoids, saponins, coumarins, lactones,	Indonesia	<i>Salmonella</i> Typhimurium (FNCC-0050)	2019	[96]
<i>Ligustrum lucidum</i> Ait, <i>Lysimachia christinae</i> Hance, <i>Mentha piperita</i> Linn and <i>Cinnamomum cassia</i> Presl	Plant	aqueous extracts	fruits, whole plants, leaves, and barks	phenolic acid and flavonoid	China	<i>S. Typhimurium</i> (ST21) (used for prevent contracting infection)	2019	[97]
Pectin of <i>Spondias dulcis</i>	Plant	aqua, ethanol	Fruit peel	oligosaccharides	Cameroon	<i>Salmonella</i> Typhimurium (ATTC 2680), <i>Salmonella</i> Typhimurium (ATTC 2488) and <i>Salmonella choleraesuis</i>	2019	[98]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	<i>Salmonella</i> serovar	Year	Ref
<i>Acacia farnesiana</i>	Plant	hexanic, chloroform, methanolic and aqueous extracts	fruits	methylgallate, gallicacid and (2S)-naringenin-7-O- β -glucopyranoside	Mexico	<i>Salmonella</i> Enteritidis (ATCC857)	2019	[99]
<i>Adansonia digitata</i>	Plant	aqueous, ethanolic and chloroform extract	leaves and stem bark	alkaloid, flavonoids and tannin	Nigeria	<i>Salmonella</i> Typhi (clinical isolate)	2018	[100]
<i>Cassia occidentalis</i>	Plant	aqueous extract	leaves	saponin, flavonoids, and tannins, glycoside, cardiac glycosides, steroids, saponin glycoside, anthraquinones and volatile oil (trace)	Nigeria	<i>Salmonella</i> Typhimurium	2018	[101]
<i>Benincasa hispida</i> Thunb (Bligo fruit)	Plant	ethanol extracts (96, 70 and 50%)	fruit	not specified (probably a polar molecule)	Indonesia	<i>Salmonella</i> Typhi	2018	[102]
<i>Citrus sinensis</i> (L) Osbeck	Plant	aqueous and ethanol (80%) extracts	peel	alkaloid, tannin, saponin, glycoside, flavonoid, terpenoid, and Phenols	Nigeria	<i>Salmonella</i> Typhi (clinical isolate)	2018	[103]
Cinammomum cassia	Plant	Sodium bisulfite (1:1), petroleum ether	oil	cinnamaldehyde	Indonesia	<i>Salmonella</i> Typhi	2018	[104]
<i>Piper aduncum</i> subsp. <i>ossanum</i> (C. DC.) Saralegui, <i>Piper aduncum</i> L. subsp. <i>aduncum</i> , <i>Mentha piperita</i> L., <i>Mentha spicata</i> L., <i>Ocimum basilicum</i> var. <i>genovese</i> L. <i>Ocimum gratissimum</i> L., <i>Rosmarinus officinalis</i> L., <i>Thymus vulgaris</i> L., <i>Melaleuca quinquenervia</i> (Cav) S.T. Blake, <i>Eugenia axillaris</i> L., <i>Citrus sinensis</i> (L.) Osbeck, <i>Citrus paradisi</i> Macfad, <i>Curcuma longa</i> L., <i>Lippia graveolens</i> (Kunth)	Plant	essential oil (aqueous)	not specified	Probably trans-cinamaldehyde, carvacrol, eugenol and acid 2,4 dihydroxybenzoic	Cuba	<i>Salmonella</i> Typhimurium (ATCC14028), <i>Salmonella enterica</i> subsp. <i>enterica</i> CENLAC (S02, S04, S06, S08, S10), <i>Salmonella enterica</i> (Sc1) isolated from a pig	2018	[105]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	<i>Salmonella</i> serovar	Year	Ref
Jacaranda micrantha	Plant	aqueous and 70% ethanolextract	leaves	phenolic compounds, tannins, flavones and saponins	Brazil	<i>Salmonella choleraesuis</i> (ATCC 10708) and <i>Salmonella</i> spp. (food isolated)	2018	[106]
<i>Allium sativum</i> and <i>Zataria multiflora</i> Boiss	Plant	aqueous oil extract	bulb and whole plant	Allicin and thymol	Egypt	<i>Salmonella</i> Typhimurium, <i>Salmonella</i> Anatum, <i>Salmonella</i> Lagos and <i>Salmonella</i> Kentucky	2018	[107]
<i>Cinnamomum zeylanicum</i> , <i>Eugenia caryophyllata</i> , <i>Origanum vulgare</i> , <i>Thymus vulgaris</i> and <i>Thymus zygis</i>	Plant	essential oil	bark, bud, flowering plant, leaves and flowers	cinnamaldehyde, linalool, eugenol, eugenyl acetate, b-Caryophyllene, carvacrol, thymol, γ -Terpinene, geraniol and p-Cymene.	Spain	<i>Salmonella</i> Typhimurium (ATCC14028), <i>Salmonella</i> Typhimurium and <i>Salmonella</i> Enteritidis	2018	[108]
<i>Citrus medica</i> , <i>Citrus limon</i> and <i>Citrus microcarpa</i>	Plant	juice (pure extract)	fruit	citric acid, hesperidin, carvacrol and thymol	Korea	<i>Salmonella</i> Typhimurium (ATCC 14028, 19585, and DT104 Killercow)	2018	[109]
<i>Equisetum telmateia</i>	Plant	ethanolic extract followed by petroleum ether, dichloromethane (DCM), ethyl acetate (EtAc) and n-Butanol (n-BuOH). Supercritical extract	stem	Kaempferol 3-O-(6"-O-acetylglucoside), 5-O-Caffeoyl shikimic acid, Catechin	Iran	<i>Salmonella</i> Typhi (PTCC 1609)	2018	[110]
<i>Thymus vulgaris</i> L., <i>Rosmarinus officinalis</i> L.	Plant	essential oils	leaves	α -pinene, Thymol, Oxygenated monoterpenes, monoterpene hydrocarbons, borneol, 1,8-cineole	Morocco	<i>Salmonella</i> Typhimurium (ATCC 14028)	2018	[111]
<i>Gracilaria verrucosa</i>	Plant (algae)	aqueous, methanolic and ethanolic extracts	whole plant	carvacrol, p-cymene and γ -terpinene	Indonesia	<i>Salmonella</i> Typhimurium	2018	[112]
<i>Sterculia</i> spp.	Plant	ethanolic extract	bark	flavonoids, alkaloids and saponins	Indonesia	<i>Salmonella</i> Typhi	2018	[113]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	<i>Salmonella</i> serovar	Year	Ref
<i>Nigella sativa</i>	Plant	aqueous and methanolic extracts and oil	seed	not specified	Pakistan	<i>Salmonella enterica</i>	2018	[114]
Rice hull smoke extract	Plant	pyrolysis of rice hulls followed by liquefaction	hull	161 components, bioactive unknown	Korea	<i>Salmonella</i> Typhimurium (CCARM8107)	2018	[115]
Basil, ginger, hyssop, caraway, juniper, and sage	Plant	essential oils	several	estragole, cis-pinocamphone, alpha-pinene (in juniper EO), a-thujone (in sage EO), carvone (in caraway EO) and curcumene (in ginger EO)	Serbia	<i>Salmonella enterica</i>	2017	[116]
<i>Ipomoea aquatica</i>	Plant	ethanolic and methanolic extracts	leaves	flavonoids	Malaysia	<i>Salmonella</i> Typhi	2017	[117]
<i>Andrographis paniculata</i>	Plant	methanolic, ethanolic and acetone extracts	leaves	not specified	India	<i>Salmonella</i> Typhi (clinical isolates)	2017	[118]
<i>Senna occidentalis</i>	Plant	methanolic extract	root and leaves	flavonoid, tannins, saponins, cardial glycoside	Nigeria	<i>Salmonella</i> Typhi	2017	[119]
<i>Grewia flava</i>	Plant	acetone, methanolic, acetylacetate and aqueous extracts	berries, leaves, bark and roots	pelargonidin 3,5-diglucoside, naringenin-7-O-β-D-glucoside, tannins, catechins, and cyanidin-3-glucoside, betulin, lupeol, lupenone and friedelin.	South	<i>Salmonella</i> Typhimurium (ATCC 14028)	2017	[120]
<i>Acacia mearnsii</i> De Wild., <i>Aloe arborescens</i> Mill., <i>A. striata</i> Haw., <i>Cyathula uncinulata</i> (Schrad.) Schinz, <i>Eucomis autumnalis</i> (Mill.) Chitt., <i>E. comosa</i> (Houtt.) Wehrh., <i>Hermbsaedia odorata</i> (Burch. ex Moq.) T.Cooke, <i>Hydnora africana</i> Thunb, <i>Hypoxis latifolia</i> Wight, <i>Pelargonium</i>	Plant	acetone extract	bark, leaves, bulb, tuber, root and corms	quercetin-3-O-a-l-arabinopyranoside (<i>P. guajava</i>)	South Africa	<i>Salmonella</i> Isangi, <i>Salmonella</i> Typhi, <i>Salmonella</i> Typhimurium	2017	[121]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	Salmonella serovar	Year	Ref
sidoides DC, Psidium guajava L and Schizocarphus nervosus (Burch.) van der Merwe								
<i>Holarrhena floribunda</i>	Plant	ethanolic and methanolic extracts	leaves	Alkaloids	Togo	<i>Salmonella</i> Typhi (clinical strains)	2017	[122]
<i>Zanthoxylum caribaeum</i> Lam.	Plant	ethanolic, methanolic, hexanic, acetone, dichloromethanic, ethylacetate and aqueous extracts	leaves	Germacrene-D, a-Panasinsene and b-Selinene	Brazil	<i>Salmonella enterica</i>	2017	[123]
<i>Rosmarinus officinalis</i>	Plant	essential oil	not specified	not specified	Iran	<i>Salmonella</i> Typhimurium (PTCC 1609)	2017	[124]
<i>Myristica fragans</i>		aqueous extracts	seed	methane, oxybis	India	<i>Salmonella</i> Typhi	2017	[125]
<i>Cajanus cajan</i> (Gandul)	Plant	methanolic extract	leaves	flavonoids, phenolics, and steroids (naringenin)	Indonesia	<i>Salmonella</i> Thyphi	2017	[126]
<i>Vitex doniana</i>	Plant	aqueous and methanolic extracts	stem-bark and leaves	phytochemicals alkaloid, saponin, tannin, anthraquinone, flavonoid, phenols, terpenoid and glycoside	Nigeria	<i>Salmonella</i> Typhi	2017	[127]
<i>Hibiscus sabdariffa</i>	Plant	aqueous water	flower calyx	not specified	Mexico	<i>Salmonella</i> Typhimurium and Typhi	2017	[128]
<i>Ziziphora clinopodioides</i>	Plant	essential oil	leaves	nisin	Iran	<i>Salmonella</i> Typhimurium (ATCC 14028)	2017	[129]
<i>Tinospora cordifolia</i>	Plant	aqueous and methanolic extracts	stem	not specified	India	<i>S. Typhimurium</i> (ATCC 23564)	2017	[130]
<i>Sonchus arvensis</i> L. (tempuyung)	Plant	ethanol extracts	leaves	flavonoids and triterpenoids	Indonesia	<i>Salmonella</i> Typhi	2016	[131]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	<i>Salmonella</i> serovar	Year	Ref
<i>Heliotropium filifolium</i> (Miers) Reiche and of <i>Heliotropium sinuatum</i> (Miers)	Plant	resinous exudate (CH ₂ Cl ₂) and hexane-ethyl acetate step gradient	fresh parts (cuticular components)	(Filifolinol) (naringenin, 3-O-methylgalangin and pinocembrin)	Chile	<i>Salmonella</i> Typhimurium (ATCC 14028)	2016	[132]
<i>Punica granatum</i> , oak, <i>Thymus vulgaris</i> and <i>Cinnamomum zeylanicum</i>	Plant	ethanolic and chloroformic extracts	peel, oak trunk, thyme fruit and cortex	gallocatechins, delphinidin, cyanidin, gallic acid, ellagic acid, pelargonidin and sitosterol; hymol, carvacrol and flavonoids; cynamaldheide; (4,5-Di-o-galloyl (+) -protoquercitol) and compound III (3,5-Di-o-galloyl (+)-protoquercito	Iraq	<i>Salmonella</i> Typhimurium (chicken isolate)	2016	[133]
<i>Scutellariae radix</i>	Plant	ethanol extracts followed by petroleum ether (PEF), chloroform (CF), ethyl acetate (EAF) and n-butanol (BF)	root	baicalin, wogonoside, baicalein and wogonin	China	<i>Salmonella</i> Typhimurium (CMCC 50041)	2016	[134]
<i>Rhus typhina</i> and <i>Achillea sintenisii</i>	Plant	not specified	aerial and root parts	not specified	Portugal	<i>Salmonella</i> Typhimurium LT2	2016	[135]
<i>Holarrhena antidysentrica</i> (Ha) and <i>Andrographis paniculata</i> (Ap)	Plant	hydroethanolic extract	leaves and stem	alkaloids, flavonoids, saponin, terpenes, phenols, tannins, glycosides carotenoids, anthraquinones, reducing sugars, phlobatannins, sterols	India	<i>Salmonella</i> Typhimurium (MTCC 733)	2016	[136]
Black tea (Kombucha)	Plant	Infusion/fermentation	leaves	Catechin and isorhamnetin	India	<i>Salmonella</i> Typhimurium (NCT 572)	2016	[137]
<i>Curcuma longa</i>	Plant	96% ethanol/essential oil	rhizomes	saponin, tannins, alkaloids and flavonoids (probably curcumin and derivatives)	Colombia	<i>Salmonella</i> spp. (nosocomial isolates)	2016	[138]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	Salmonella serovar	Year	Ref
Harungana madagascariensis	Plant	aqueous infusion	leaves	not specified	Cameroon	Salmonella Typhimurium	2016	[139]
<i>Piper retrofractum</i> , <i>Phyllanthus emblica</i> , <i>Terminalia chebula</i> , <i>Terminalia bellirica</i> , <i>Piper sarmentosum</i> , <i>Plumbago indica</i> , <i>Piper leptostachyum</i> , <i>Piper nigrum</i> , <i>Zingiber officinale</i> , <i>Piper betle</i> , <i>Garcinia mangostana</i> and <i>Caesal piniasappan</i>	Plant	95% ethanol	fruits, root, stem, rhizome, leaves husk, peduncle and wood	Plumbagin, Piperine, Eugenol, Myristicin, Gingerol, Shogaol and Brazilin	Thailand	Salmonella spp. (piglet isolates)	2016	[140]
Punica granatum	Plant	ethanolic extracts and peel flour	peel, seeds	ellagic acid or ellagic acid derivatives, ellagitannins and HHDP-gallagyl-hexoside	Spain	Salmonella Anatum, Salmonella Typhimurium	2016	[141]
<i>Abrus precatorius</i> L.	Planta	aqueous extracts	leaves, seed and root	steroids, saponins, phenolics, tannins, flavonoids, terpenoids and alkaloids	Nigeria	Salmonella Typhi	2016	[142]
Piliostigma thonningii	Plant	hexane and aqueous extracts	leaves	Tannins, terpenoids, flavonoids, alkaloids, steroids and phenols	Nigeria	Salmonella Typhi	2015	[143]
<i>Baillonella toxisperma</i>	Plant	ethyl acetate, acetone, methanol and hydro-ethanol mixture (2: 8) extracts	leaves and stem bark	terpenoids, tannins, flavonoids, phenols, saponins, steroids and cardiac glycosides.	Cameroon	Salmonella Typhi	2015	[144]
Wood vinegar	Plant	vinegar	natural vinegar	not specified (probably pH 4.15–4.59)	Thailand	Salmonella Enteritidis (DMST15676) Salmonella Typhimurium (DMST17242)	2015	[145]
<i>Aristolochia indica</i> , <i>Carica papaya</i> , <i>Eclipta alba</i> and <i>Phyllanthus amarus</i>	Plant	methanol extracts	leaves	n-Hexadecanoic acid	India	Salmonella Typhi (clinical isolate)	2015	[146]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	Salmonella serovar	Year	Ref
Curry: <i>Capsicum annuum</i> , <i>Citrus hystrix</i> , <i>Cuminum cyminum</i> L., <i>Allium ascalonicum</i> L., <i>Allium sativum</i> , <i>Cytopogon citratus</i> , <i>Alpinia galangal</i> , and coconut milk	Plant	water, UHT coconut milk, and fresh coconut milk were used as extractants. Also ethanolic and aqueous extracts (Garlic)	fruit, leaves and peel	not specified	Thailand	<i>Salmonella</i> Enteritidis	2015	[147]
<i>Portulaca oleracea</i>	Plant	ethanol extracts	leaves	probably quercetin	Thailand	<i>Salmonella</i> Typhi	2015	[148]
Eucalyptus, mint, cinnamon, garlic, thymus	Plant	oil	bark and leaves	probably cinnamaldehyde/thymol	Egypt	<i>Salmonella</i> Enteritidis, <i>Salmonella</i> Charity and <i>Salmonella</i> Remiremont (chicken isolates)	2015	[149]
Piper crocatum (Red betel vine)	Plant	70% ethanol, followed by n-hexane, ethyl acetate, chloroform and methanol	leaves	saponin and flavonoids	Indonesia	<i>Salmonella</i> Typhi	2015	[150]
<i>Dionisya revoluta</i>	Plant	methanol extracts	aerial parts	not specified	Iran	<i>Salmonella</i> Enteritidis	2015	[151]
<i>Achyranthes aspera</i>	Plant	methanolic extracts followed by chloroform, n-hexane, n-butanol, ethyl acetate and water	leaves	Phenolic compounds, oils, saponins, flavonoids, alkaloids and tannins	Pakistan	<i>Salmonella</i> Typhi (ATCC 19430)	2015	[152]
<i>Alocasia brisbanensis</i> , <i>Canavalia rosea</i> , <i>Corymbia intermedia</i> , <i>Hibbertia scandens</i> , <i>Ipomoea brasiliensis</i> , <i>Lophostemon suaveolens</i> , <i>Syncarpia glomulifera</i> , <i>Smilax australis</i> and <i>Smilax glycyphylla</i>	Plant	hydro-ethanolic (80%) and aqueous extracts	not specified	<i>L. suaveolens</i> leaves: α -pinene, β -caryophyllene, aromadendrene, globulol and spathulenol; <i>S. glomulifera</i> : α -pinene, aromadendrene and globulol; <i>S. glomulifera</i> leaves wax: eucalyptin and <i>S. glomulifera</i> bark: betulinic acid, oleanolic acid-3-acetate and ursolic acid-3-acetate.	Australia	<i>Salmonella typhimurium</i> —Group B (clinical isolate)	2015	[153]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	Salmonella serovar	Year	Ref
Citrus sinensis	Plant	ethanol, methanol, chloroform, and diethyl ether	peel	saponins, terpenoids, alkaloids, flavonoids, tannins and cardiac glycosides	Pakistan	<i>Salmonella</i> Typhimurium (isolated from spoiled fish)	2015	[154]
Nigella sativa	Plant	essential oil	seed	thymoquinone, p-cymene, α-phellandrene, α-pinene, β-pinene, cis-carveol, trans-anethole, thymol, α-longipinene and longifolene	Arabia and India	<i>Salmonella</i> Paratyphi A, <i>Salmonella</i> Enteritidis, <i>Salmonella</i> Typhimurium, <i>Salmonella</i> Heidelberg, <i>Salmonella</i> Agona, <i>Salmonella</i> bongori	2015	[155]
Allium sativum L.	Plant	aqueous extracts	bulb	not specified	South Korea	<i>Salmonella</i> Typhimurium	2015	[156]
Spirulina platensis	Plant (algae)	ethanolic and chloroform extracts	cell extracts	not specified	Bangladesh	<i>Salmonella</i> Typhi and <i>Salmonella</i> Paratyphi	2015	[157]
Curri = Capsicum annum, Citrus hystrix, Cuminum cyminum L., Allium ascalonicum L., Allium sativum, Cybopogon citratus, Alpinia galangal, and coconut milk	Plant	not specified	fruit, peel, seed, bulb, stem, rhizome	especificados por compuesto, reportes previos	Thailand	<i>Salmonella</i> Typhimurium (DT104b)	2015	[158]
Vitex doniana	Plant	ethanolic and Acetone extracts	leave, stem bark and root	tannin, saponins, flavonoid, carbohydrate, glycoside, protein and steroid	Nigeria	<i>Salmonella</i> Typhi	2015	[159]
Polygonum odoratum	Plant	essential oil	leaves	Dodecanal 55.49%, Decanal 11.57%, Pentacosane 7.26%, p-Anis aldehyde 6.35% mainly	Thailand	<i>Salmonella choleraesuis</i> subsp. <i>choleraesuis</i> (ATCC 35640)	2015	[160]
Kelussia odoratissima	Plant	aqueous and ethanolic extracts	leaves	not specified	Iran	<i>Salmonella typhimurium</i> (ATCC 14028)	2014	[161]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	<i>Salmonella</i> serovar	Year	Ref
Coptidis rhizoma (CR), Houttuyniae herba, Taraxaci herba, Glycyrrhizae radix, Puerariae radix, and Rhizoma dioscoreae	Plant	aqueous infusion	herbs	berberine, ginsenoside Rb1, and glycyrrhizin	China	<i>Salmonella</i> Typhimurium (ATCC 6994) and ST21 (pig carrier)	2014	[162]
Nymphaea tetragona	Plant	50% methanol followed by dichloromethane, ethyl acetate, and butanol	body and root	DFNTE: hydrocarbons (46.46%); EFNTE: methyl gallate (70.44%), 1, 2, 3- benzenetriol or pyrogallol (20.61%), and 6, 8- dimethylbenzocyclooctene (5.90%); BFNTE: 2- hydrazinoquinoline (57.61%), pyro-gallol (20.09%), and methyl gallate (12.77%)	Korea	<i>Salmonella</i> Typhimurium (QC strain KTCC2515 and clinical isolates ST171, ST482, ST688, and ST21)	2014	[163]
Virgin coconut oil and palm kernel oil	Plant	essential oil	fruit and seed	not specified	Indonesia	<i>Salmonella</i> Typhi (ATCC 786)	2014	[164]
Virgin Coconut Oil	Plant	oil	fruit	not specified	Indonesia	<i>Salmonella</i> Typhi (ATCC 00786) and <i>Salmonella</i> Typhimurium (ATCC 14028)	2014	[165]
Piper nigrum L.	Plant	ethanolic extracts and chloroform extracts	fruit and seed	tannins, alkaloids and Cardiac glycosides, and tannins, alkaloids and flavonoids	India	<i>Salmonella</i> Typhi	2014	[166]
<i>Morus alba</i> var. Alba, <i>Morus</i> <i>alba</i> var. Rosa and <i>Morus rubra</i>	Plant	hydromethanolic and aqueous extracts	leaves and stem	phenolics and flavonoids	Tunisia	<i>Salmonella</i> Typhimurium (ATCC 14028)	2014	[167]
<i>Khaya senegalensis</i>	Plant	ethanolic, methanolic and aqueous extracts	stem bark	saponins, tannins, reducing sugar, aldehyde, phlobatannins, flavonoids, terpenoids, alkaloids, cardiac glycoside and anthroquinones	Nigeria	<i>Salmonella</i> Typhi	2014	[168]

Parental organism	Origin	Extraction method	Segment used	Bioactive compound(s)	Location	<i>Salmonella</i> serovar	Year	Ref
<i>Mentha longifolia</i>	Plant	Ethanollic extracts	leaves	not specified	Iran	<i>Salmonella</i> Typhimurium	2014	[169]
Palm oil (Sania), Virgen coconut oil (Palem Mustika) and soybean oil (Mama Suka)	Plant	oils	seeds and fruits	not specified	Indonesia	<i>Salmonella</i> Typhi (ATCC 19943)	2014	[170]
Heliotropium	Plant	methanolic extract, 2nd extraction with petroleum ether, ethylacetate and chloroform and aqueous	aerial parts	not specified	Iran	<i>Salmonella</i> Enteritidis (ATCC 13311)	2014	[171]
Woad, heartleaf houttuynia herb, baical skullcap, coptidis, andrographitis,	Plant	aqueos extract	bark, leaves, root, rhizome and fruit	not specified	China	<i>Salmonella</i> Typhimurium	2013	[172]
<i>K. senegalensis</i> bark and leaves, <i>S. alexandrina</i> leaves, <i>S. argel</i> leaves, <i>T. indica</i> L. fruits and <i>T. foenum</i> , <i>graecum</i> seeds	Plant	methanolic extract	bark, leaves and seed	not specified	Sudan	<i>Salmonella</i> Typhi (ATCC19430) and <i>Salmonella</i> Paratyphiphy-A (ATCC 9150 / SARb42)	2013	[173]
Phyllanthus amarus	Plant	aqueous and ethanolic extracts	leaves	Phyllanthin, Nirtetralin, Linalool, phytol	India	<i>Salmonella</i> Typhi	2013	[174]
Carissa opaca	Plant	95% methanol followed by n-hexane, ethyl acetate, chloroform, butanol and water	fruits	orientin, isoquercetin, myricetin and apigenin (and probably other secondary metabolites)	Pakistan	<i>Salmonella</i> typhy (ATCC 0650)	2013	[175]
<i>Mangifera indica</i>	Plant	acetone extract	leaves	mangiferin	Pakistan	<i>Salmonella</i> Typhi (clinical isolates) and <i>Salmonella</i> (ATCC 14028)	2013	[176]
<i>Sinapis alba</i> L.	Plant	essential oil	seeds	4-hydroxybenzyl isothiocyanate	USA	<i>Salmonella</i> spp. (isolates) <i>Salmonella</i> Typhimurium (ATCC 14028), <i>Salmonella</i> Abaetuba and <i>Salmonella</i> Dessau	2013	[177]

Table 5.
Summary of reported natural products of combined origins against salmonella.

congress and meeting proceedings where useful data were present. NPs and bioactive principles were registered according to the molecules isolated by the authors and/or in contrast to the literature. This search was not exhaustive, rather, we aim to obtain a random sample of information using the simplest terms on the matter of natural products for salmonellosis.

All these works were developed on all continents, being Asia the most active, followed by Africa, America, Europe and Oceania (**Figure 1A** and **B**). It is noteworthy that much of the research was developed in equatorial locations where biodiversity is abundant. Country-wise, there is a remarkable number of publications from India and Indonesia, where incidence of *salmonella* is high. The map constructed for the distribution of publishing frequencies, in fact, resulted fairly similar to a previously reported *salmonella* incidence map (**Figure 1A** versus [9]). The number of articles per year showed an upward trend though it stabilizes in the last five years (**Figure 1C**).

The spectrum of biological activities evaluated are as diverse as the application to which they are oriented, from the study of antimutagenic, antioxidant,

Animal species	Vegetable species	Microorganisms	Solvents	Bioactive compound
Identification of genus and, if possible, species	Geographical site	Identification of genus, and species	Explanation for its selection	Isolation technique
	Harvesting data	Reference strain identification	No-reactivity assessment	Structure determination method (MS–GC, for instance)
	Ethnobiological identification	Identification of origin: • Clinical isolate • Food • Soil ...	No-interference assessment	
		Identification by PCR	No-toxicity assessment	

Table 6.
Checklist proposed for NPs research.

Figure 1.
(A) Distribution map of publishing frequencies. (B) Continental frequency. (C) Publications per year.

anticancer, anthelmintic, antiviral, antifungal activities to its antibacterial potential, being its activity against *salmonella* spp. one of the most studied activities.

The analysis of the last decade research render studies exploring the antibacterial activity against *salmonella* serovars of crude extracts and essential oils, from compounds of natural origin, as well as their components. A wide variety of these NPs have been evaluated from commercial formulations, products of animal origin such as honey, propolis, milk and chitosan, through complete plants and/or their components (roots, stem, leaves and flowers), up until products of microbial metabolism as crude protein extracts, membrane and cell wall glycosides, natural antibiotic peptides (nisin). Several chemical compounds such as water, ethanol, methanol, acetone, formaldehyde, hexane, ethyl acetate and chloroform were used as solvents by direct maceration extraction rather than vapor distillation or more complex methods.

Nonetheless, we believe the description of methodological conditions could further standardized with the inclusion of a fixed set of data. According to our observation, the list of items enlisted in **Table 6** could be a minimal checklist when performing NP research.

7. Conclusions

Salmonellosis, caused by *salmonella* serovars, is still an uneradicated disease both in industrialized and developing countries. Multidrug resistance is a phenomenon increasingly widespread and alternative tools for disease control are urgently necessary. Natural products research based on traditional medicine is nowadays a consolidated study field full of vitality, *salmonella* research in particular has an upward trend with work being develop worldwide. Authors cited within this chapter explored biological activities of local organisms for the solution of salmonellosis for their communities, although a minority showed interested in foreign resources or commercial formulations. We observed a higher number of active researches on countries with diverse and abundant natural resources coincidentally also with high salmonellosis incidence. Even though our search is a minimal sample from the whole work being published on NPs and salmonellosis, it reveals certain features of the field.

Most of the works displayed in here are initial screening in vitro studies, maybe due to the scarce number of sources for funding in vivo applications. In perspective, NPs studies for clinical applications is a potential goal in order to control this disease.
